On the other hand, Mr. Murchison shows that, taking the whole capital invested in public British lead mines (dividend and non-dividend), the average return is more than double that of railways, and if the private lead mines were included he believes the difference would be still more marked. Why, then, he asks, should it be more difficult to get capital for promising lead mines than for desirable railways? The price of lead ore continues good and steady; the same quality which in 1870 realized £11 13s 6d to £13 10s 6d per ton, now fetches £14 10s, "notwithstanding the general cry of depressed trade and business generally. Whether during times of peace or war, lead is an article which maintains its value, either for commercial and social requirements or for destructive purposes; while as a metal it is comparatively cheap." Money is now said to be literally a "drug" in the market, and there are unmistakable signs that capitalists are sadly in want of some means of employing their accumulated idle funds; and we believe they can in many ways do much worse than invest in legitimate British lead mines. Mr. Murchison gives, as usual, some particulars of the principal lead mines, dividend and progressive, and we heartily recommend his remarks to the attention of the public.—*London Mining Journal.*

On a New Water-Pressure Pumping Engine at Clausthal.

The completion of the Ernst August deep adit level at Clausthal having relieved the older mines of a large amount of water that was formerly pumped up and discharged through the shallower adit known as George III's deep level, the water-power thus rendered disposable has been utilized in the establishment of a central deep pumping station for the whole district in the new Queen Mary shafts, where a quantity of 770 gallons of water may be lifted per minute to a hight of 754 feet. The fall of water available as a pressure column is 1,207 feet; but in order to avoid the necessity of heavy reciprocating rods, the engines, designed by Bergrath Jordan, of Clausthal, in imitation of the newer kind of direct-acting steam pumping engines used in collieries, have been placed at the bottom of the shaft, 1,958 feet below the top of the pressure column, and 751 feet below the deep adit through which the water is discharged. The construction of the engines is similar to that of a direct-acting steam pump, there being two double-acting pressure pistons, each having a double-acting plunger pump placed behind it, the opposite ends of the piston rods being connected with a fly-wheel, which carries the valve gear for the engines. This consists of a pair of eccentrics, moving piston valves which, in order to prevent shocks in the tubes at the change of stroke, are made somewhat shorter than the admission and discharge ports, so that when in mid stroke the water ways are not completely closed. The main pressure cylinders, with their pistons and rods, are of gun metal, as well as the valve pistons, which work in a tube lined with the same metal. Both engine and pump pistons are without packing, being turned to fit accurately in their working barrels, and are provided with annular grooves to prevent the passage of fluid from one side to the other (Ramshottom's construction).

The pistons of the pressure engines are 12.2 inches in diameter, those of the pumps 12.9 inches, the length of the stroke common to both being 24 6 inches. The piston rod which is carried through both cylinder covers is 6.5 inches thick. The effective volume of the cylinder from these dimensions requires a consumption of 14 5 gallons of water per revolution, apart from that expended by the valve cylinder, while the corresponding discharge of the pumps is 17.2 gallons, so that the effective duty of the engines appears to be about 66 per cent. of the power developed by the pressure column. With a piston velocity of 19.7 inches per second, about 50 revolutions are made, and 830 gallons of water are lifted per minute. The pumps have short suction pumps and double best valves, whose seats are one-fourth of the sectional area of the pistons, after allowing for the section of the rods. The power water, after doing its work in the engines, is discharged with that lifted by the pump through a common rising pipe. At this speed the velocity of the water in the driving column and rising pipe is about 3.28 feet per second. The former has to resist a pressure at the lower end of 60 atmospheres, and the latter of 23 atmospheres. The author points out that although a plunger-lift of 754 feet is very different from anything used in his own district (Freiberg), a single lift of the same hight was adopted in Juncker's water-pressure engine at Huelgoat, and that that at Illsang, forcing brine to a hight of 984 feet, with one pump, worked for nearly 40 years without stopping. He concludes with the expression of a doubt as to whether the disadvantage of using rotary water-pressure engines under such a heavy backwater pressure may not more than counterbalance the advantages derived from the abolition of pump rods in the shaft.—*Berg und Huttenmannische Zeitung.*

India Rubber.—Consul Green, reporting on the trade of the Brazilian provinces of Para and Amazonas, states that the crop of india rubber, which was little over 2,000 tons in 1861, has been steadily increasing ever since, and reached 6,763 tons in the year 1875. He is able to add that there are vast rubber yielding districts which have never yet been touched, and that if the rumors that the old districts are becoming exhausted should be correct, there is no reason why the yearly collection should not, in ordinary seasons, continue the steady increase it has shown for some years past, so long as there is an outlet for the produce in the European markets. The increase in 1875 was less than usual, but he observes that this was owing to an exceptionally long, rainy season and much sickness, and must not be taken as a criterion of a diminution of population or an unwillingness of the inhabitants to work.—*Colliery Guardian.*

Nickel.

Our contemporary, *La Houille*, extracts the following article on nickel in New Caledonia from a paper published in that colony: Nickel has now so much importance in our colony, that we intend to give an article on it every month, so as to keep our fellow colonists informed of the value of their produce in the markets of Europe, and, in the second place, to give really true accounts of the quantities exported, the number and value of our mines, and the kind of people we are.

After doubting for a long time of the reality of the discoveries made near the end of 1874 at Mont d'Or, about 18½ miles from Noumea, our people at length began to explore for nickel with great zeal and activity. The presence of ore was proved at a large number of places in our island, and people began to believe that mines might be opened anywhere and everywhere, and that we were about to enter on a period of unlimited production. Fears were entertained of a deficiency of ships to take the ore away, and it was imagined that Europe and America together would hardly consume all that was going to be raised. But these dreams and exaggerations were soon over; and the present position of affairs is that the total amount exported in the course of the past 14 months—*i. e.*, from the date of the earliest extraction to the present day—is 2,000 tons.

The Boa Kaine mine sends away from Canala to Germany every month about 125 tons; The Bel-Air mines at Onaillon have raised 1,200 tons, of which 160 tons were sent to London at the beginning of 1875. In April, 1876, 550 tons were shipped for Havre per the *Buffon*, and in May 430 tons by the *Nouveau-Mondelli*. The remaining mines, all told, including the Fatma mine, have not sent away more than an aggregate of 100 tons. About the end of the next month (August?) 550 tons will be shipped on board the *Indien* for Havre. That is the whole truth about the heavy shipments of which we have heard such varying accounts.

Will this production increase? Possibly, and yet we cannot be certain. We hear that the proprietors of the Bel-Air mines have resolved to ship no more after they have dispatched the *Indien*, before they have learnt the reception which their three former consignments meet with in Europe.

Letters brought from Europe by the *Egmont*, on the 8th, have informed us that the English smelters have formed a coalition—a ring—for the purpose of abstaining from buying, and so speculating for a fall; and that a lot of 35 tons put up to auction remained without a bid. The French and Germans, too, we find, await the arrival of the *Buffon*, and the result of an analysis of its cargo, before they make up their minds what to do. On the other hand it is certain that nickel is getting in use more and more every day. A letter we received from a friend in Paris, last May, tells us that nickel is quite the rage; hardwaremen, cabinet makers, leather workers and others are abandoning gilding and bronzing in favor of nickel. We cannot think, therefore, that any difficulty will be experienced in placing the quantities already shipped; but our larger mine owners, alarmed at the prospect of coalitions of merchants, such as the London ring, are actively engaged in erecting smelting works, in the conviction that whatever a ring can do with unsmelted ore in the docks, they will be powerless to work any wickedness on the metal itself. The smelters of nickel in Europe do not number, it seems, more than seven or eight, while the number of buyers of the metal is practically unlimited. The owners of our principal mines are solid enough to stand out against a fall; but we should be extremely sorry, for the sake of the colony, if they were to stop raising and sending. A cargo of ore, which was being made up to be sent to France, was countermanded on the arrival of the last mail from Europe; and the entire energies of the owners are turned in the direction of building furnaces for the transformation of their profitless ore into profitable metal.

The present situation of nickel may be summarized as follows: In New Caledonia, a total current production of 450 tons per month, and a resolve on the part of mine owners to stop sending ore, in order to send metal. In England, a coalition speculating on a fall in prices; in France and Germany, a fear lest too much should be exported by us, and at the same time a doubt as to the exactitude of the figures in the statistics of extraction, consequently, complete abstinence.

This is our reason for wishing to throw a little light on the subject of nickel, and we beg the help of our fellow colonists, who may thus contribute to the prosperity of an industry to which the colony owes so much. In addition to the supplies in New Caledonia, there is a very considerable deposit in America. This is situated near the Gap, Lancaster county, Penn., on the divide between Chester and Pequea valleys, and is said to be the largest yet discovered in the world. It is the only deposit of nickel worked in America. Copper has been worked for 70 years in the same mine which now yields nickel. The latter ore, first noticed in 1856, has a gray color, is very heavy, and so hard that it has to be mined entirely by blasting. After the ore has been broken into fragments it is put into kilns holding 80 or 90 tons each, and calcined, the heat being first produced by the burning of a small quantity of wood, and continued by the conversion of the expelled gas. The smelting process is much the same as that of iron.

DEWEY & CO.

American & Foreign Patent Agents

OFFICE, 224 SANSOME STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditionsly; Patent reissnes taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoronghly conducted.

Our intimate knowledge of tbe varions inventions of this coast, and long practice in patent business, enable ns to abundantly satisfy onr patrons; and our snccess and bnsiness are constantly increasing.

The shrewdest and most experienced Inventors are fonnd among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through tbe colnmns of our widely circulated, first-class journals—thereby facilitating tbeir introdnction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, witb the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britsin, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brszil, Bavaria, Holland, Denmark, Italy, Portugal, Cnba, Roman States, Wnrtemberg, New Zealand, New South Wales, Qneensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD wbere Patents are obtainable.

No models are required in European countries, but the drawings and specifications shonld be prepared with thoronghness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of tbe country) SOONER than any other agents.

Tbe principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar witb, and have fnll records, of all former cases, and csn more correctly judge of the value and patentability of inventions discovered bere than any other agents.

Situated so remote from the seat of goveroment, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in trans mittiog specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assnred that their communications and business transactions will be held strictly confidential by us. Circulars free.

Home Counsel.

Our long experience in obtsining patents for Inventors on this Coast has familiarized us with tbe character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a frnitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants wbich will interfere with tbeir obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutnal conference of legiiimate bnsiness and professional men is mutnal gain. Parties in doubt in regard to their rights as assignees of patents or pnrchesers of patented articles, can often receive advice of importance to tbem from a short call at our office.

Remittances of money, made by individnal inventors to the Government, sometimes miscarry, and it has repeatedly happened thst applicants have not only lost their money but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circuler and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

ISSUED OCT. 1st, 1876.

Testing and Working Silver Ores.

The above is the title of an illustrated work of 114 pages, for miners and prospectors by Chas. H. Aaron, which has jnst been issued by Dewey & Co. Mr. Aaron has managed to give many nseful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope:

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ora formatioo, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working sample, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sniphur, etc. Under the head of "Leaching Processes" are the titles, Smelting, Mexican process, Kroecke's process, Chilean process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the anthor describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel, trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improved retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements a small mill, sampling tailings and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner of long working experience on this coast.

The book is a serviceable one for miners' and prospectors' use. Price, post free, (in leather,) $2.00. Address Dewey & Co., MINING AND SCIENTIFIC PRESS, 224 Sansome street, San Francisco.

The Scientific Press Engraving Company.

As has been announced in our columns, tbis company is prepared to do fine wood engraving on favorable terms. Mr. E. Schultze, managing partner, served a thorough tuition in his branch of art in Germany and New York, and has since bad over seven years' experience in designing, drawing and engraving in California. Customers can place tbeir orders in Mr. Scbultze's hands with the full assurance of receiving satisfaction as to quality of work and fairness of price.

FOR SALE CHEAP,

At Fenner's Machine Works,

NO. 7 FIRST STREET, SAN FRANCISCO.

ONE SECOND-HAND HASKINS' UPRIGHT ENGINE AND BOILER, eight H. P., in complete order, 6½ cylinder. It was too small for the work, and I replaced it with a larger one, and have thoroughly overhauled this; it cost, new, one year ago, $1,175; price now, $750. Also, A SMALL SECOND-HAND ENGINE, four H. P., cylinder 3½x10, with regulator, new piston, packing, slides, guides, heater, boxes, etc., and all thoroughly repaired, good as new; price, $250. Also, A SMALLER SECOND-HAND ENGINE, of two H. P., cylinder 2¾x6, thoroughly overhauled, new piston, packing, etc.; price, $125.

I am prepared to build small engines from two to 15 H. P., at short notice and on reasonable terms. Also, all kinds of Jeweler's Tools, Rolls, Presses, Dies, Shears, etc. Old rolls ground and warranted true.

Address, O. B. FENNER,
No. 7 First street, San Francisco.

PAUL'S DRY PROCESS.
I am now prepared to test gold and silver milling ores in any quantity from TEN POUNDS to FIFTY TONS, and assert my ability to prove, by machinery NOW UP, and open to public inspection, and by practical testing of its merits, that I can increase the yield of gold mills, working wet batteries and copper plates, from FIFTY to ONE HUNDRED PER CENT., and on silver ores a much larger percentage than by pan amalgamation, and at less expense than any known method of working quartz well; and from some "gold" ores of California can extract more silver extra with the gold, which is now lost, than all the expenses of mining and milling. Having had 25 years' practical experience in milling gold and silver ores, I presume to know whereof I speak, and AM PREPARED TO PROVE ALL I ASSERT. These mills, for simplicity, cheapness practicability and perfection in working, challenge the skill of the age to surpass. Quartz miners who desire to investigate and have their ore tested, are invited to a critical examination of the machinery and process, and can receive permits for examination, particulars and pamphlets explaining process by calling at my office. ALMARIN B. PAUL.
Room 20, Safe Deposit Building, 328 Montgomery St

ERICH G. GAERTNER,
MINING ENGINEER.
All classes of mining properties reported on, consultations had on reduction of ores of all descriptions, plans for furnaces and reduction works furnished, and the construction of them superintended. Ore tests made at the office,
309 California street, Room 8 9.

Continued from Page 349.

beneficial flow of pnre air through the entire southern portion of the mine. An east cross-cut from the north drift on the 2000 tt level has just been started, to ascertain the full width of the ore vein at that point.

DAYTON.—The sump of the main shaft has been considerably enlarged, and the pumps lowered to a point 40 feet below the 900-ft level. At the 900-ft level a large working station is being opened preparatory to drifting through the ledge. The north and south prospect ng drifts on the 700-ft level are each steadily advancing, both having very encouraging ors prospects.

YELLOW JACHET.—The drift north at the 1940-ft level bas completed connection with the drift south from the Imperial, giving a very valuable circulation of air. A cross-drift is now started west at the north line of the mine, and another will he started east at that point. Drifting south at the 2040-ft level is progressing in very favorable looking ground.

JULIA.—The main south drift on the 1800-ft level is steadily advancing, the face in broken quartz and porphyry mixed. Two cross-cuts have been started from this drift, one east and the other west, at a point 642 feet south of the main shaft.

BELCHER.—The usual amount of milling ore is being extracted, keeping the mills steadily running. Sinking both the main incline and the air and drain shaft is making good progress.

GOULD & CURRY.—The pumping machinery at the surface is being erected as fast as the perfection of the work will admit of. The old pumps are being taken out and the new ones put in.

NIAGARA.—Sinking the main incline is making splendid headway. A double track has been completed in the main shaft, so that double the amount of rock can be hoisted, or the extraction of ore commenced whenever the company so desire. The mine was never in so good a condition as now.

OPHIR.—Recent openings made in the ore stopes on the 1500 and 1600-ft levels have shown an improvement in both quality and quantity of ore. This steady improvement indicates that the river mills will he enabled to start into full operation again in a very short time.

SAVAGE.—The pumps are kept running at their full capacities. The general progress has been steady, and to-day the water is reduced to a few feet below the 200-ft level.

NORTH CARSON.—Shaft, 490 feet deep. Material at bottom porphyry with streaks and feeders of good sulphuret ore coming in and being continually cut through as sinking progresses. Considerable water is met with.

BUCKEYE.—The north drift on the 300-ft level is following the ore veln and is affording considerable good ore in its progress. It ia being run to the northward to tap a chimney of rich ore known to exist in that portion of the mine near the surface. It is expected that the supply of ore will he sufficient by 1st December to again etart the Hope mill.

BULLION.—The north drift on the 2000-ft level is being pushed steadily ahead, with much more favorable indications of ore.

SUTRO TUNNEL.—Total length of tunnel, 14,052 feet. Face of header in tough porphyry with occasional streaks of white quartz and thin clay seams. A small accident to the machinery at shaft No. 4 a few days ago interrupted operations a little, hut not to any serious extent. Everything is going ahead as before, and the Ingersoll and Burleigh drills are doing good work in the face of the header.

SOUTH OPHIR.—Preparation are being made to commence sinking a fi st-class three-compartment working shaft, which will intereect the ledge at the depth of 300 feet. The tunnel, which is 500 feet in lengih, shows a fine looking ledge, the main ore streak of which is some four or five feet in width, giving excellent assays.

PROSPECT —Better progress is being made in advancing the main west drift at the 400-ft level, the material being somewhat softer and more favorable, improving continually as farther advancement is made.

WARD.—Sinking the main shaft was suspended two days during the past week in order to give an opportunity to arrange double-deck cages and water tanks, to facilitate the hoisting of rock and draining the water. Sinking is being again prosecuted.

COSMOPOLITAN.—About 10 tons of ore per day is added to the accumulation on the dump, and another milling run will soon he commenced

HERALD.—The fine ore prospects at the hottom of the main incline are daily growing more favorable as the shaft attains depth.

FLORIDA.—The shaft is down 680 feet, having cut through the east clay wall of the ledge at a depth of 568 feet. The last 13 feet penetrated bas heen in broken quartz, interspersed with spots and streaks of exceedingly rich ore. The prospects for a good paying ore development grow better.

SOUTH COM-TOCK —The face of the east drift from the 300-ft station is in a little softer and more favorable material. Superintendent Leunon has great confidence that he will develop a good paying ledge in that direction before long.

CROWN POINT.—Sinking the main incline is making splendid progress. There is no water to hother, notwithetanding the fact that the hottom is far helow the point yet reached hy the Belcher and Crown Point pump shaft, at which point the water is now taken. Sinking is being pressed ahead with great vigor, the progress being greatly expedited hy the Burleigh drills.

BALTIMORE AND AMERICAN FLAT.—The winze from the east cross-cut from the north drift on the 1050-ft level is down 60 feet, the hottom still in fine ore, affo.ding every appearance of forming an extensive hody. The east crose-cut on the 1450 ft level is steadily advancing with every indication of soon cutting the main ledge.

SILVER HILL.—Sinking the main incline is making steady progress, the hottom i i hard blasting rock.

NEW YORK.—The enlargement of the main shaft is progressing very favorably nnder the energetic management of Superintendent Owens. When this compartment is completed the shaft will he one of the very best on the line of the Comstock.

TRIPOLI.—The pay ore so developed hy the north drift on the 300-ft level is 10 to 12 feet in thickness and is of excellent qualiiy. The prospecta of the mine are growing better every day.

NORTH CON. VIRGINIA.—Sinking the main sbaft is making splendid progress. It is now considerably below the 1100-ft level. Air pipes have heen extended to the hottom of the shaft for driving Burleigh drills hy compressed air.

LEVIATHAN.—Some very fine streaks and hunches of ore, giving good aasays, have been passed through hy the drift north at the 600-ft level.

CHOLLAR-POTOSI.—Daily yield, 100 tons of ore, the assay value of which is $31 per ton. There is no change of value in any of the ore producing sections.

TAHOE —The erection of the new hoisting works hutlding is getting well under way.

KOSSUTH.—The new ore dump is completed and the hoisting of ore commenced. The ore is of a good milling quality, and the appearances aro that almost any desirable quantity can be extracted when desired.

EAST ALTA.—Thie is a new mine, located about 1,200 feet to the eastward of the Alta shaft. The location is an excellent one. Sinking a fine three-compartment working sbaft is ahout heing commenced under the able superintendency of Sam Owens, one of the oldest and best of Comstock miners.

LAKE BAYAN —The foundations for the reception of the huge pumping machinery were finished to-day. A car-load of the machinery arrived on the ground yesterday, and its erection will now he prosecuted with all speed possible.

CALEDONIA —The flood of water encountered last week has heen again overcome and sinking the shaft resumed.

LADY WASHINGTON.—The east drift from the 860-ft station, cross-cutting the ledge at that point, is now in 122 feet to-day. The face is in ledge porphyry, dry and firm, hut liable to change into regular vein material at any time.

WEST BELCHER.—The main ore hody is now being cut into hy the southeast drift. There is plenty of good pay ore developed at the 300-ft level, and above, and milling the ore will he commenced in about 10 days.

AMAZON & GLASGOW.—Every effort is being made to crowd the shaft downward to the 400-ft level at the very earliest moment possible.

UNION CON.—Driving the north drift on the 1900-ft level is making good progress, the face in ledge matter.

MEXICAN.—The upraise from the north drift on the 1465-ft level is being pushed vigorously forward. The west cross-cut from the same drift is showing some fine quartz mixed with spots of good ore.

PHIL. SHEHIDAN —Sinking the shaft is going ahead at a very rapid rate, the hottom still in porphyry mixed with quartz.

CABINET.—The work of enlarging the shaft to three compartments is progressing at a lively rate.

MONUMENTAL.—Preparations are made for putting up efficient machinery and resuming the development of the mine in good earnest in a very few days.

SUCCOR.—Putting in the new pumps is making good progress. The erection of the powerful pumping engine is going steadily forward.

ROCK ISLAND.—Tearing out the old pumps and columns, preparatory to putting in the new, is making good progress.

BEST & BELCHER.—The drifts and cross-cuts on the 1700-ft level are cleaned out, repaired and put in good working condition again.

HALE & NORCHES.—The pumps are kept steadily running and the water is being slowly lowered.

TUSCARORA DISTRICT.

GRAND PRIZE.—*Silver State*, Nov. 15: The Humboldt reduction works have just completed the working of a lot of 76 tons of ore from the Grand Prize mine, in Tuscarora district. This ore was worked by the ordinary wet process, without roasting, and produced $25,136, or an average of $334 per ton. The ore worked up to 91 per cent. of its assay value, and the bullion averaged 996 fine. These results from this new mining camp are certainly very encouraging, and show that there is rich free milling ore in central Nevada. We understand that Jasper McDonald and G. W. Grayson, of San Francisco, are the owners of this mine.

WHITE PINE DISTRICT.

THE TUNNEL.—White Pine *News*, Nov. 18: Work at the Eberhardt & Aurora company's new tunnel is progressing finely; 40 feet per week is now the average being made. At the present time it is in a distance of 400 feet. When completed the tunnel will be 6,000 feet long.

WILL START UP.—We are informed that the Eberhardt & Aurora companya mill, after undergoing thorough repair, will again commence running on Monday next.

PAY DAY.—Last Wednesday the Eberhardt & Aurora company paid off all their employees on Treasure Hill, and on the following day at Eberhardt.

Arizona.

MINING.—Cor. Arizona *Miner*, Nov. 10: Some recent trips down and up the Hassayampa creek, where ten and 12 years ago the placer miners used to make an ounce a day with a rocker, shows that the old creek is not worked entirely out yet. A short time since, a little above the old Montgomery mine, Duff & Co. took out $1,200 in about three weeks, and Duff put out for the Centennial. Just below the mouth of Copper creek, Kelly and Hemphill are opening a claim that promises one-half ounce diggings; and above Copper creek, Merrill & Co. have a fine piece of ground that pays them from $6 to $10 per day. Half a mile below the Umqua mine, two men are sluicing with good pay. A mile above, a party of Frenchmen are opening a har claim with good prospects, through five feet of ground, and between there and the Clipper saw mill several men are working with rockers and sluices, making ordinary wages. Nearly all the placer miners are also interested in quartz, and with J. R. Darroche, I examined the Commissary, Buck, Silver Star, Orphan Boy, Buckskin, and Often veins, and found them all looking well for the developments made and evidently only needing more expenditure to put them in paying condition.

Some ore we got on the dump of the Chance, which has not been worked for nearly 10 years, gave an assay of $490 per ton in silver, hut as the shaft is filled with water up to within 30 feet of the top, we could not examine the vein. Houghtelin & Curtain are sinking a shaft on the Silver Prince, on the main vein, nearly opposite the 100-ft shaft on the little vein, and are down about 70 feet, intending to go 30 feet deeper. They are getting some very good ore in a small seam, which shows every indication of near approach to a good body of rich ore. At the Peck business is lively. After making a contract with the Aztlan mill to crush 200 tons of ore, the Peck company put George Opdyke in charge of the mine, and he has been opening it in good shape. One hundred and fifty tons have been sent to the mill by pack trains and the rest will he delivered in a few more days. Some croakers said when the bargain was made that the ore could not he taken out fast enough to keep the mill running, hut as those who knew best stated at the time the getting out of 200 tons has only begun to show where the ore is. The average assay value of the ore sent to mill for the days previous to the 24th inst. was $1,428 per ton.

Colorado.

MATHEWS & CO.'S CONCENTRATION WORKS.—Colorado *Miner*, Nov. 11: Repeated trials having demonstrated the inntility of the sizing machine, which has been built in this mill, it has been removed, and revolving screens are now being placed in its position. The managers have met with many unlooked-for delays, and ore has been crowding their bins for some weeks, hnt they are determined to have all their machinery in complete running order before they start to concentrate ore.

OUR MINES.—The interest manifested in the presidential election has not lessened our production of silver ore, and from all quarters we hear encouraging reports. Mill men state that they are receiving more ore than at any time for nine months past, and Brown, Sherman, Republican, Democrat and Leavenworth mountains show a larger number of paying mines than usual. The price of silver holds up strongly, being quoted now at $1.17⅞, and gold at about $1.10.

ATLANTIC.—The lessees have for some time been engaged in the work of development and have taken out little ore. They have sunk a shaft 70 feet in depth from the heading of the lowest level, have run a drift 25 feet from the hottom of this shaft, and started a stope above the drift. Good ore is in sight, and the 70 feet of stoping ground will yield many thonsand dollars before it is exhausted. A mill run this week gave highly satisfactory results. A tunnel has been started which will cut the vein 200 feet helow the lowest level. The boys have shown an energy and determination in their operations which entitle them to success.

ELECTROTYPING ORGANIC SUBSTANCES.—In electrotyping insects, ferns, etc., M. Cazeneuve immerses the object in a solntion of nitrate of silver in wood naphtha. When partially dried the object is treated with ammonia, the result being a donble salt easily reduced. After being thoronghly dried, the object is exposed to the vapor of mercury, and the snrface is completely metallized in a few minutes. It oan then be placed in the hath, and metal deposited in the usnal way.

Thanksgiving.

The early bird of winter holidays is at hand. Thanksgiving, the day of family re-nnions, the day when cene-bearing grandfather and table-drumming baby meet on a common level and look in opposite direotions—np and down the course of time. The day when they who hold the homestead rejoice to see its walls embrece again the loved ones from afar. The day when the family tree is laden with the full round of its fruition; for then its brenches show fruit, blossoms and tiny buds together clinging. The day when the devotional rejoice and give thanks. The dey when the undevout rejoice and give not God the glory. The joys of Thanksgiving, like the rain from heaven, fall alike upon the thankful and those who take the joys and forget the thanksgiving. Such is the generons charaoter of the blessings which are vouchsafed to men, and yet he who forgets to receive these gifts in the spirit which their bonnty is fitted to invoke loses the greater share of the priceless bestowal.

If there is anything which this generation needs, it is the spirit of true thankfnlness, the feeling of trne gratitnde. Rushing along the tide of prosperity, gathering the fruits of progress such as have been given to no generation since the world began, there has arisen a wide sentiment of self trnst and confidence which would be glorious were it coupled with a wider recognition of the sonrce whence come to men those qualities which compess success and advancement. It reqnires no creed to teach men to he thankful. It does not need a sermon to teaoh the thoughtfnl that there is a Power rnling in the effairs of men, whom the mind instinctively honors, and exalts itself in the honoring. To enconrage this spirit of true thenksgiving among the people, the President of the United States and the Governor of California proclaim Thursday, November 30th, a day to be observed with thanksgiving and praise—a day to ceese from ordinary avocations and give thanks to Divine Providence for the blessings of the year.

Thns, es is cnstomery, comes the formal call for the favorite holiday of the American people. Christmas and New Year's we join the world in observing, bnt Thanksgiving is a day peculierly onr own. As onr readers assemble in their happy homes and joy crowns the generous feast, it will be easy to give the thankful spirit possession of the heart and let it banish care and vain ambition. Then will come to mind the many blessings for which we may be thenkful. We have peace while great nations are vexed with wars. We have safety while provinces have been the scenes of massacre and outrage. We have prosperity while upon the other hemisphere dronth, famine end the cyclone have slain their thonsands and tens of thonsends. Are not these fitting themes for thanksgiving?

In onr own State, as our governor reminds us in his proclamation, may he fonnd greet blessings for which to thank Dtvine Providence. Favored of all the earth is California. During the year there have been taken many steps in onr onward progress. Bright as onr winter sunshiue is our promise for the fntnre. Outliving the disadvantages of onr hasty growth, we are advancing on the plane of true prosperity. Resting from the building of colossal fortunes we are making homes. Forgetting, little by little, to count men hy their millions, we are developing a truer standerd of manhood and womenhood. The era of wealth to be seized and borne away is closeo; the time of industry, giving its success toward ennobling and developing and beautifying onr favored State, is one which calls for truest thanksgiving.

We have attempted to glorify the thankful spirit in onr words a bove. This is, indeed, the greatest treasure which Thausgiving day can bestow. To all olasses are its joys outheld. The man with broad acres reaching from the valley stream to the mountains, with his pastnres filled with noble animals, his stables with fleet steeds and his granaries with wealth of golden grain, might easily be thankful, and if he looks beyond his wealth to the giver and holds his heritage as a trust for noble deeds, happy, indeed, he is. So too with the manufacturer whose workshops are filled dnring the long honrs with the hnm of profitable indnstry, and wh olooks from the elegance of his city mansion upon the breadth of his gardens with rare beauties of leaf and flower. So too the miner, who views the richness of his claim, the perfection of his machinery and feels in his pockets the weight of precious metal. To all these possessors of iudividual prosperity it wonld seem the thankful spirit would rise like the waters of the fonntain, and refresh and beantify the man and all his deeds. Thus, indeed, should the thankful spirit rise with prosperity. Thns wonld wealth be noble and thus would the world bless the man who possesses it, because the truly thenkful spirit will make the rich man a benefactor, and the community will praise him as their friend. Let this be the thought for the rich man's Thanksgiving day.

Valuable as is the thankful spirit to the abode of wealth, it is a hnndredfold more a blessing when it inspires those whose lot is cast in less fruitful fields. The thankful spirit shines most brightly when its luster borrows nought from the gleam of gold. It comes like a benediction npon the happy home where homely oomforts dwell and where hearts join with hands in labors for life and loved ones. By its light the cottage becomes a palace; the toil-stained hands are beautiful; and the faoe traced with lines of cere is lighted with joys nnspeekable. The home filled with the spirit of thanksgiving is foretaste of the home above. Let it be a cottage sweet with the perfnme of vines and flows, let it be the single room of city toiler or the miner's hnt, it matters not, for the thankful spirit may adorn them all. The spirit of contentment and thenksgiving will rest the tired frame and meke the poor man rich indeed.

As we are preparing onr laden tables for the day of thanksgiving bounty, let ns not forget those whose measure of prosperity will not call them to a feast. All around ns both in city and conntry there are homes whose inmates we can fill with thanksgiving, oheer, and joy. Think of the little eyes which never have beheld the oomforts which we provide so lavishly; think of the little hands which will grasp nought but a crust unless we give them finer fare on the day of glad thanksgiving. The thankful spirit is generous. It longs to impart its joy. Remember the poor on the day of rejoicing. Thus will the day be twice blessed. Thus in giving thanks ourselves we may promote thanksgiving.

Items of Interest from the Mines.

We give below items of interest from prominent mines, most of which are collated from letters of the respective superiutendents on file at the offices in this city. Considerable of this news is later than that procured from the interior jonrnals:

When the pnmp is pnt in below the 900-foot station of the Dayton, they will oommence opening up the 900-foot level.

The furnace at the Pinal, inclnding all the machinery necessary for smelting, is completed.

In the Belcher they are mnoh tronbled with water in the main incline and will be obliged to put down a large compressed air pnmp to keep the water low enough to allow sinking.

In regard to the sale of Meadow Valley tailings, the snperintendent says: Sold the entire pit of them for $2.50 per ton, and $1,000 of the forfeit money was paid to-day and the parties bind themselves to have everything in running order by the 1st of February, when a payment of $4,000 will be due.

The clean-up for the last six days' run of ten stamps of the Eureka (Grass Valley) mino was 255 ounces of amalgam.

The west drift on the 11th level of the Raymond & Ely has now a total length of 1,799 feet. The fissure still maintains itself, but the formation is getting very irregular and broken and does not look as promising as heretofore. The flow of water from the face of this drift still continues bnt does not materielly interfere with the progress of the work. The raise which is being carried up from 10th level is still showing a very promising formation, with some small spots of good ore, hut very limited in extent.

The ore body on track floor, northeast drift, 400-foot level of the Justice, is fully 27 feet in width, composed of fair milling ore. They are sending 250 tons of ore daily to the mills.

The average of the ores worked from the Manhattan last week was $211.78 per ton.

In the Baltimore Consolidated mine the developments at the different points on the 1050-foot level continne to be of great interest. The winze from cross-ont No. 1 on this level is down 55 feet. The ore is widening at this depth and is of a much richer quality than it was on the 1050-foot level. The upraise from the same cross-cnt is in ore of a very good character.

Letter from snperintendent of the Electrio mine says: The dam is now finished and we now have a permanent weter power second to none in the State; the dam is well made, snbstantial in every respect and is good for years. I have resumed work in the tuunel and will now pnsh it along as fast as possible nntil the ledge is reached. There is nothing wanting here now, but the oompletion of the tunnel, then can see no reason why dividends will not take the place of assessments.

The snperintendent of the Grand Prize says: Will now give you a full statement of the Grand Prize. Ore worked at the Humboldt reduction works of this place. Amount of ore, 150,807 ponnds; assay value per ton, $382.03; total assay value, $28,052.36; percentage obtained in bnllion, 90 30; average assay valne of tailings per ton, $31.05; amount of bnllion shipped, $25,356.66.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

FOR WEEK ENDING NOVEMBER 14TH, 1876.

FEEDERS FOR THRESHING MACHINES.—William Hutchings, Fresno, Cal.

ELECTRIC SIGNALING APPARATUS AND KEY.—William Lundberg and Daniel F. Leahy, Portland, Ogn.

ORE CONCENTRATORS.—Lewis Stoner, Virginia City, Nev.

KNIVES FOR PITTING FRUIT.—George W. Tarleton, San Jose, Cal.

STUMP PULLERS.—John B. Forbes, Olympia, W. T.

PROCESS AND APPARATUS FOR DEHYDRATING AND REFRIGERATING AIR.—Robert H. Lucas, S. F.

SASH BALANCES.—Barnet M. Whiting, Los Angeles, Cal.

GAG-RUNNERS FOR HARNESS.—William M. Blain, Salinas City, Cal.

SPARK EXTINGUISHERS.—James W. Donaldson and Allen C. Miller, Fairfield, Cal.

NAPHIN HOLDERS.—Benjamin F. Hardy and Victoria A. Hardy, S. F.

Singular Specimen.

The following item recently appeared in the Virginia, Nevada, *Enterprise:* "Recently, while preparing the foundations for the new pumping machinery at the Gould & Curry, the workmen had occasion to break a large piece of volcanic tufa, of which the foundations are being laid, and there found a geode containing some beautiful stellated bunches of fibrous gypsum. The crystals are from one-half to an inch in length, and as clear as water. The singularity is that these crystals should be found in the heart of a great rock quarry of leelite or rhyolite, for such is the tufa formation from which the geode was taken. It is to be presented by Superintendent Osbiston, through Professor Stewart, to the society of Pacific Coast Pioneers."

Although we are usually very careful in copying such items as the above from our contemporaries, we did not consider a close scrutiny essential in copying anything pertaining to mining matters from a journal of such standing as the Virginia *Enterprise*, published as it is in the center of the most prosperous and extensive mining region in the world. Accordingly the item was transferred to our columns, and due credit given, without examining it very closely. Happening, however, to notice it more particularly this week, we found that the geological terms were somewhat mixed. The term "tufa" is applied to a fragmental group of sedimentary rocks, being the accumulations of lapilla, fragments, ash or other substances ejected from volcanoes and more or less firmly compacted together. Fibrous gypsum does not occur in transparent crystals L elite is a *mineral*, a red variety of orthoclase feldspar, and not a rock according to the accepted meaning of the word. Rhyolite is a volcanic acidic rock belonging to the trachyte group, with a compact enamel-like or vitreous matrix, enclosing grains or crystals of sanidine, oligoclase, mica or even quartz.

General News Items.

ANOTHER revolutionary movement is apparent in Mexico.

SILVER bullion was quoted in London, Wednesday, at 54¼d per ounce.

A PORTION of the Sonoma county prismoidal railway is now in operation.

THE telegraph informs us that from 120,000 to 215,000 lives were lost in the cyclone in India.

THE railway conductors' excursion party, consisting of some 70 Eastern conductors, with their families, is now "doing" San Francisco.

SMALL-POX has not by any means entirely disappeared in this city. There were several deaths last week.

EX-PENSION AGENT H. C. BENNETT has been indicted by the Grand Jury, and action has been begun against his bondsmen.

THE Postal Commission, appointed under an act of Congress to ascertain how the postal service can be improved, is now holding sessions in this city.

MRS. ELIZA ROSS, wife of Captain George Ross of the bark *Lizzie Williams*, fell off the Oakland pier on Thursday night, and was drowned before aid could be procured.

IT is now understood that construction work in all the navy yards will be stopped in a few days. There is no money to pay the workmen the appropriations at the last session having been very small.

THE San Francisco general fund, school fund and street fund are exhausted at present, but Treasurer Hubert anticipates that before the 20th of next month sufficient money will stand to their credit to enable him to meet all demands.

THE Army Reorganization Board continues its sessions at the War Department. The discussions of the board refer particularly to providing for a speedy and effective enlargement of the army in time of necessity. Among the propositions is that of making 75 men the quota of each company, and to be kept at this standard in time of peace, but in time of war the maximum to be 250 men.

KNIGHT'S American Mechanical Dictionary is a book for all persons who make, buy, sell, use, or want to know anything about tools for machines, or are curious as to the history and development of mechanic art. It is a descriptive word-book of tools, instruments, machines, chemical and mechanical processes; civil, mechanical, railway, hydraulic and military engineering; a history of inventions; general technological vocabulary; and digest of mechanical appliances in science and the industrial and fine arts, etc. For circulars or price address or apply to A. Roman & Co., wholesale and retail booksellers, 11 Montgomery street, San Francisco.

"SPEAKE WELL," ETC.—We would return thanks for an exchange and back numbers of the MINING AND SCIENTIFIC PRESS, published by Dewey & Co., of San Francisco, Cal. It is a well edited, interesting, and valuable journal, and speaks well for our Pacific neighbors.—*U. S. Milling and Manufacturing Journal.*

GOOD PRINTING INK.—We prefer Chas. Eneu Johnson's printing inks, having used them on this paper for the past four years. H. S. Crocker & Co., printers, stationers, blank book and paper dealers, are Johnson's S. F. agents.—DEWEY & Co., Publishers.

BOUND VOLUMES of the MINING AND SCIENTIFIC PRESS from Jan. 1st, 1864, are for sale at the office at $5 per volume, two volumes a year. Unbound at $3 per volume.

Mining and Scientific Press.

THIS PUBLICATION, SO VALUABLE FOR MINERS, MECHANICS AND MANUFACTURERS,

Will enter upon its THIRTY-THIRD Semi-Annual Volume on Saturday, January 6th, 1877. It has ever been and will still continue to be the aim and object of the publishers to make the PRESS

A Practical and Interesting Journal.

To this end, we aim, through the constant watchfulness of our editors and correspondents, to seize upon everything new in the way of mining and the various processes connected with the saving and separating of the precious metals, and place the same before our readers at the earliest day. It has been well said that

A Newspaper is a Window

through which men look out upon all that is going on in the world. Our window is a special one, so placed and arranged as to bring within the scope of its vision all that is going on

In the World of Mining, Mechanics and Science.

Without a paper of this kind, the miner or mechanic is shut up in a small room or shop and can know but little of what is going on in the world around him in relation to his particular calling. In this age of rapid progress books are necessarily slow and behind the times. It is only through papers devoted to the specialty which he has chosen that one can be easily apprised of the discoveries and improvements which are constantly being made by his fellow workers, and without a knowledge of which he soon becomes a lag gard in the race.

The Value to the Community

Of such publications in disseminating important information, in checking useless and exploded experiments and in instigating important enterprises, can scarcely be overrated. Through them the readings and observations of thousands are collected and collated, and brought directly to the shop or table of the reader without any effort of his own. For a mere trifle of cost he is regularly furnished with an encyclopedia of just the information he needs—an unbound book forever issuing but never finished.

Nowhere in the Wide World

Is such an aid more needed than by the miner of California. It is needed alike in the mill, in the mine and in the placer. We have here

The Largest Mining Field on the Globe,

Embracing a variety of minerals nowhere else found within the boundaries of a single field. We have here also, men gathered from every quarter of the globe, bringing with them the collective wisdom of the world,

Useful, Practical and Directly from the Field

Of labor. The mustiness of books has been brushed away, and their minds are stored not only with the experience of the past, but also with the practice of the present. It is to this fact that we are indebted for our present

Able List of Correspondents,

Through whom we are able to promise to our readers so much that cannot be collected in the mere routine of office work. By the aid of such help our editors will be able, during the coming year, to do more than ever in furnishing information which shall be

Fresh, Novel and Interesting,

And which shall comprise all that is known of the latest and best means for saving gold and silver, and for economizing labor and cost in that direction.

Our Illustration Department

Will still continue to form an important feature, and no effort will be spared to make it of the greatest possible local and general interest to our readers. The important matter of

Home Manufactures and Inventions

Will also largely occupy the attention of the publishers and editors, and will be constantly encouraged, as an important means of furnishing employment to those who are seeking our shores, and adding to the wealth of the Pacific coast.

The Large and Increasing Circulation

Of a journal thus devoted exclusively to useful and practical information, speaks more in our behalf than anything we could say of ourselves, and is an encouragement to its further increase, especially in these times of trifling and trashy journalism.

The class of readers who are interested in such a publication as this, have no need to be anything more than merely reminded that such journals are necessarily more costly than those of a lighter class, such as are read by the "million" and thrown aside as soon as read. Considering the character and location of the MINING AND SCIENTIFIC PRESS, our rates are as favorable as can possibly be afforded and do justice to the great industries in aid of which we are laboring.

A Handy Map

Of California and the principal portion of Nevada will be furnished free to all subscribers who pay one year in advance, during the year 1876. The map is plain, printed on tinted paper, about 18x20 inches, showing townships in California, and the counties, railroads and principal towns in California and Nevada.

We Prepay the Postage

On all papers sent to subscribers in the United States.

SUBSCRIPTION RATES, payable in advance: One year, $4. Sample copies free to those who will assist in obtaining subscribers.

DEWEY & CO., Publishers,

No. 224 Sansome street, S. F.—Jan. '76

To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect July 1st, 1874, provides that in addition to the regular publication, daily or weekly, of the assessment and sale notices as heretofore,

PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where the principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

DEWEY & CO., Publishers.

UNITED STATES

Mineral Land Laws, Revised Statutes,

And Instructions and Forms Under the Same.

We have just issued a pamphlet containing the general mineral land laws of the United States, with instructions of the Commissioner of the Land Office. The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872, with Instructions by the Commissioner of the Land Office; Mining Statute of July 26th, 1866; Mining Statute of July 9th, 1870. Forms required under Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Survey; Application for Patent; Proof of Posting Notice and Diagram of the Claim; Proof that Plat and Notice remained Posted on Claim during Time of Publication; Register's Certificate of Posting Notice for Sixty Days; Agreement of Publisher; Proof of Publication; Affidavit of $500 Improvements; Statement and Charge of Fees; Proof of Ownership and Possession in Case of Loss or absence of Mining Records; Affidavit of Citizenship; Certificate that no Suit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no Known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will be sold, post-free, for 50 cents. It should be in the hands of every one having any mining interests. DEWEY & CO.,

Publishers of MINING AND SCIENTIFIC PRESS, S. F.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Office Cascade Blue Gravel Mining

Company.—NOTICE:—A meeting of the stockholders of the Cascade Blue Gravel Mining Company will be held at the office of the company, 311 California street, rooms 3 and 4, second floor, San Francisco, Cal., on Monday, November 20th, 1876, at two o'clock P. M., for the purpose of disposing of the company's stock, and authorizing the sale of the entire property of the company, with any other business that may come before said company. R. F. KNOX, President,

J. M. BUFFINGTON, Secretary.

San Francisco, Oct. 13th, 1878.

Cerro Bonito Quicksilver Mining Company.

Location of principal place of business, San Francisco Cal. Location of works, Cerro Bonito mining district, Fresno county, Cal.

Notice is hereby given, that at a meeting of the Board of Directors held on the 13th day of November, 1876, an assessment (No. 1) of four dollars per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, 418 California street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 18th day of December 1876, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the eighth (8th) day of January, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. W. CLARK, Secretary.

Office, Room No. 2, 418 California St., San Francisco, Cal

Eagle Quicksilver Mining Co.—Location

of works, Santa Barbara county, Cal. Principal place of business, San Francisco, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 30th day of September, 1876, an assessment (No. 9) of two hundred and fifty ($250) dollars per share was levied upon all the shares of said company, payable immediately, in gold coin of the United States, to the Secretary, at his office, rooms 5 & 6, No. 302 Montgomery street, San Francisco, Cal.

Any shares upon which said assessment shall remain unpaid on Wednesday, the 27th day of November, 1876, shall be deemed delinquent, and will be duly advertised on Saturday, the second day of December, 1876, for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fourth day of December, 1876, as provided by the articles of agreement of said company, to pay the delinquent assessment, together with cost of advertising and expense of sale. By order of Board of Trustees. WM. H. WATSON, Secretary.

Golden Sun Gold Mining Company.—

Notice is hereby given that the regular annual meeting of the stockholders of the Golden Sun gold mining company will be held at the office of the company, No. 302 Market street, (up stairs,) San Francisco, Cal., on Monday, the 11th day of December, A. D., 1876, at one o'clock P. M., for the election of Trustees of said company for the ensuing year. The transfer books will be closed on December 4th, 1876, at three o'clock P. M., and remain closed until after the meeting. By order of the President.

JOSEPH PENTECOST, Secretary.

Mariposa Land and Mining Company

of California. Location of principal place of business, San Francisco, Cal. Location of works, Mariposa county, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the ninth day of November, 1876, an assessment, No. 8, of one dollar per share was levied upon the capital stock of the corporation, payable immediately, in United States currency, to the Secretary at the office of the Company, room 33, Nevada Block, No. 309 Montgomery street, San Francisco, Cal., or to the Assistant Secretary, at the office, No. 9 Nassau street, New York, N. Y.

Any stock upon which this assessment shall remain unpaid on the 11th day of December, 1876 will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the eighth day of January, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

LEANDER LEAVITT, Secretary.

Office, Room No. 33, Nevada Block, No. 309 Montgomery street, San Francisco, Cal.

☞Send for our illustrated catalogue.

Marine Screw Engines

And BOILERS for driving Model Yachts from one to ten feet in length, and Row-Boats or Skiffs 16 feet and upwards in length; either plain castings, partly finished, or complete ready for use, so constructed that a speed of from six to twenty miles per hour can be easily obtained.

The Engine can be quickly detached from the Yacht or Boat, and is then suitable for Agricultural, Domestic, Mechanical, Commercial or Amateur requirements, when small power only is needed.

☞100 Scroll Work Designs free on receipt of Stamp. GEO. PARR, Buffalo, N. Y.

THE O'HARRA

CHLORIDIZING FURNACE.

Gnaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing by this Process:

Two cords of wood at $6	$12.00
Two firemen at $4	8.00
1500 lbs of salt at 1½c	22.50
Wear of shoes and power	1.50
Cost for 15 tons	$44.00
Cost for one ton	2.93½

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Consolidated Co.'s mines, in the Peavine District. For further information, apply to

D. J. O'HARRA,

Reno, Nevada.

PICKERING ENGINE GOVERNOR.

Vallejo Foundry, October 17th, 1876.

MESSRS. NEYLAN & YOUNG, San Francisco,

Agents "Pickering Governors."

Gents:—The 10 two-inch Improved Speed Adjusting Governors I bought of you this year for my Patent Straw Burning Threshing Engines give splendid satisfaction. They far surpass for regularity of speed any Governor that I have ever seen, and I have seen all of the best kinds; I have seen the main belt fly off the pulley several times this season while threshing, and the engineer did not discover it, so perfectly was the speed maintained, until he was told of it; this I consider something wonderful; I consider the Governor absolutely perfect, so far as speed is concerned. I bought, and put on to one of my engines a Shive Governor, to see which was the best and after one season's trial I have no hesitation in saying they are as far superior to the Shive, or any other Governor that I have seen or used, as the Shive Governor is to the old Butterfly Valve Governor. I wish you would send me the lowest price that you can furnish 25 Governors for next season's engines.

Yours, respectfully, I. L. HEALD.

LOOK

The Great Western Scroll Saw Co.'s New and Improved $5 00 Foot and Steam Power Scroll and Bracket Saw is the best one yet invented. With it men and boys are making from $3 to $10 per day. We will send you a Machine, six Saws, 15 Patterns and two feet of prepared wood on receipt of $5. Address,

GREAT WESTERN SCROLL SAW CO.,

IMPORTANT NOTICE.

Reduction in Price from 16 Cents to 12 Cents Per Pound.

Owing to our largely increased business, the present low price of Iron from which our Steel is manufactured and the improved facilities for casting and forging, we take great pleasure in announcing that from and after this date we will supply our IMPROVED CAST AND FORGED STEEL SHOES AND DIES FOR QUARTZ MILLS at 12 cents per pound, delivered at San Francisco or Sacramento, instead of 16 cents, as heretofore.

We also furnish Steel Plates for Blake and other Ore Crushers, Steel Gut Gearing, etc., for Mills and Hoisting Works, Steel Pan Shoes, Battery Cams and Tappets, etc.

Address all orders, with dimensions or drawings, to

CAST STEEL SHOE & DIE CO.,

JAMES' SINGLE TRACK RAILWAY.

This is the best and cheapest style of railroad in the world. It can be made and kept in repair for less than the cost of a county road. It can overcome any grade, and make any curve. Can be run on wood or iron (wood the best). It places railroads within the reach of any village. Can be used to great advantage in transporting coal, ore, gravel, rock, lumber, or any class of freight. Any company or persons desiring a cheap and safe railroad will do well to correspond with

"Faith and Confidence"

LIVERMORE, Oct. 1st, 1875.

MESSRS. DEWEY & Co., Patent Solicitors: *Gentlemen*—Yours of the 29th ult. containing my patent to Elevated R. R. duly received, and I hereby return my sincere thanks to the MINING AND SCIENTIFIC PRESS Patent Agency for your promptness and honesty in regard to our husine·s connections. I have received a flood of circulars from Eastern firms, desiring to deal with me, hut I have declined any communication with them and prefer, as soon as circnmstances will permit, to negotiate with and patronize a home institution; one in which I have faith and confidence—DEWEY & Co.

Again thanking you for your promptness in securing my patent, I remain, obediently your·,

WM. H. HARRISON.

HOW TO STOP YOUR PAPER.—If a subscriber wishes to stop his paper, do not direct the postmaster to retnrn your paper. That will not stop it. Do not write upon it and return it yourself. That lays you liable to a fine. There are three ways to stop it: 1st. When you subscribe, state that you wish the paper to stop at the expiratiou of the time paid for. 2d. If you did not so expressly order, send a postal card, to reach us any time before the expiration. 3d. If you have neglected these two simple methods, and the time to which you have paid is past, send a letter enclosing pay for each paper issued since your subscriptiou expired, at the rate of eight cents a copy or 33⅓ cents a month. If your paper does not stop promptly thereupon, you may he assured your letter has been miscarried; and, to test the fact, send a "postal" at once, that measures may he instituted for finding it or recovering the mouey.—*N. Y. Independent.*

No. 10.

Coppers and Mills.

Among other original or very early owners in the various small but rich claims at Gold Hill were Paul Coppers and John H. Mills, proprietors of what was for a time known as the Coppers & Mills ground, which for several years made a large and profitable production. Joseph Webb, an assayer by profession, owned one half of Coppers' interest, the two being joint proprietors of and running a saloon at Gold Hill meantime. Webb passed from the earth plane a good while ago, and if he has since been keeping company with Dives it will not be because he died possessed of the riches imputed to that unhappy personage. Webb's estate was by no means hurtfully large, having barely sufficed to defray his funeral expenses and make his accounts square with the world. Coppers also suffered a financial collapse, after which he emigrated to Idaho, where he is said to have again made some money. John H. Mills still lives at Gold Hill, where he continues to be interested in mines and mining affairs, his fortunes since the period we are speaking of having fluctuated widely. At times he has been accounted rich, and is now said to be at least tolerably well off. He enjoys the reputation in the community where he lives of being a man of integrity, energy and first-rate business capacity. He is one of the most popular men in Nevada, having held a number of high official positions, among others that of Speaker in the lower branch of the State Legislature.

The Eclipse Ground,

Covering 30 feet on the richest part of the Gold Hill bonanza, was purchased from Comstock in 1859, by Wm. and Alexander Henderson, brothers, who that summer arrived in Washoe overland from Missouri, two of their companions, named Allen and Hudson, having afterwards become equal partners with them in the ownership of this property. The consideration paid Comstock for this piece of ground, consisted of an old horse and $40 in money. Being unacquainted with the business of mining, these men, notwithstanding the low price at which they had bought their claim, ran themselves in debt in their attempts at working it. The following year DeLand, who had advanced them considerable money to enable them to keep operations in progress, took the management of the mine, seeing no other way to save himself from loss. At first the ore which paid well was reduced at custom mills; when funds enough had in this manner been accumulated a mill of their own was put up, the net earnings of which sufficed for a long time to pay a monthly dividend of $25,000, being $5,000 to each proprietor, DeLand having by this time become a one-fifth owner. In 1861 Allen was killed, having been shot through the head while prospecting near the town of Aurora in the State of Nevada. Alexander Henderson returned to Missouri. William, his brother, married in Washoe and afterward settled in San Jose, California, where he has a fine residence and is now living, being in good circumstance; Hudson we have lost sight of and DeLand is a denizen of San Francisco, still actively engaged in mining, milling and kindred pursuits.

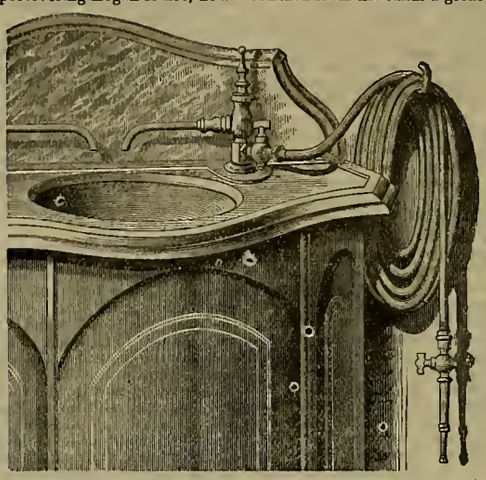
Logan and Holmes

Bought, in the summer of 1859, a section of the rich ground at Gold Hill, which, so long as they continued to own it, went by the name of the Logan & Holmes claim. In the fall of that year they put up several water-driven arastras on Carson river, near the site of the present town of Dayton, then called Chinatown. The next year they erected on this spot extensive reduction works, and for awhile prospered and made money. The cost of these works, coupled with an unfavorable turn in their mine and some other untoward events led to a turn of luck, and finally to such embarrassments that the most of their property passed from their hands, leaving them comparatively poor. Holmes, during his prosperous days, married a young wife, but survived this event only a short time, having died in 1865, leaving little money or property behind. Logan still lives and has, in the role of prospector and miner, been for many years past pursuing the fickle and fugacious Goddess of Fortune in the mountains of central and eastern Nevada without being able to quite overtake her. At White Pine he caught a glimpse of her vanishing form, and afterwards at Pioche actually laid his hand upon her, but somehow she managed to elude his grasp. The active and persevering Logan is not, however, the man to give up, and will yet possess himself of a fair share of this world's lucre if only his lease to earth life shall be renewed for a year or two longer, as he is said to own some very promising locations which only require a little capital to make their wealth practically available.

Of all these early-day Gold Hill nabobs, none were more heard of at the time, nor did any scatter their money with a freer hand, than

John Harrold,

Who, with his partner, John Drynan, owned one of the best claims at this famous locality. Born at the South, and bred to the business of overseer on a large slave plantation, his natural frank and generous disposition was apt to manifest itself in such an imperious way as often involved him in trouble with others. It was this sort of schooling that led him, on the outbreak of the late civil war, to take such a pronounced stand on the side of the South, that the United States authorities felt compelled to arrest and imprison him; a proceeding that greatly exasperated him and his friends at the time, but which Harrold himself did not afterwards very strongly condemn. For two or three years he realized from his claim a great deal of money,



TREMBLEY'S PATENT HOSE ATTACHMENT.

but, having one or two actual and perhaps many more "quasi" partners, with hosts of boon companions, political confreres and hangers-on, amongst whom he shared his income freely, he failed to get much ahead, even while his mine was yielding princely revenues. With deeper working the ores depreciated in value, while the cost of extracting them rapidly increased, and but few years elapsed before Harrold, with his lavish expenditures, was forced to part with his ground; and, although he still retained an interest in several other claims about Gold Hill, they failed to replenish his coffers; and his old friends falling away or being unable to assist him, he was finally borne on one of those tidal waves of excitement that occasionally swept over Nevada across the deserts towards the east, fetching up at last with the great army of the dead broke upon the Pogonip-enveloped hills of White Pine, where he became enfeebled in health and utterly cleaned out in purse. After drifting about for a while in that desolate region, aided by some friends, he joined a party that had been formed for working the gold mines of Honduras. This company are said to be meeting with fair success, and expect in the course of a year or two to take out a good deal of money. Harrold, being in feeble health, does the cooking for his companions and thus manages to maintain his interest in the concern, and, should his life be spared, it is not improbable that he will once more partially recuperate his fortunes and return to the scenes of his former successes and failures. Drynan, his partner, who was a different style of man, saved some money and returning afterwards to California, bought a homestead and settled in Oakland, where he is now living, having for some time past held the position of usher in the mint.

"STRUCK IT."

Patent Hose Attachment.

There are so many causes of little fires, which may easily grow into great ones, that the ingenuity of inventors has been taxed to supply some prompt, simple, and effective means of extinguishing fires at the start without calling on the fire department. Such a device is herewith illustrated, it being a hose attachment to a wash-basin faucet. The cut will give any one who ever saw a garden hose a perfect idea of its construction and use. The merits claimed for it are these: It is always in order; it is right at hand when a fire first breaks out, and can be made to throw immediately an effective stream on an incipient fire. The foregoing merits make it an element of security in a house, and when its value shall have become well known its use in a dwelling ought to lessen rates of insurance.

The cost of the attachment is very slight, and the inventor says that $35 and upwards will provide attachments enough to protect any ordinary house in every part, from garret to cellar. The inventor, D. G. Trembley, 103 South Fourth street, Brooklyn, New York, is desirous of selling town, county, or State rights in the invention.

Struck It.

The little sketch on this page, illustrative of the early mining days, when labor and not capital was needed, and when a pick, pan and shovel, combined with a little energy, were all that were necessary to make a pile, will recall those "days of gold" to the minds of many of our readers. The hardy miner, with a smile on his face, is holding out a nugget he has found in the pan and pauses in his work to show the lump to his companions. Although those halycon days are past when nuggets were plentiful and rich claims plenty, the miners of our coast have cause for thanksgiving yet. The mines generally are yielding well all over the coast and the past year has been a prosperous one. Our mining population has pretty steadily worked at good wages, and they are much better off in this respect than their brethren in other parts of the world. Steady employment can always be found for steady men in the mining districts, and even where miners do not own their own claims they can be pretty sure of making a good honest living. Though fortunes were made quickly in early days they were spent quickly too; but experience, the best of all teachers, has taught us all a beneficial lesson in this respect, so that if money comes harder now it is more appreciated and not recklessly squandered.

The Sportsman's Club of California has between 180 and 190 members in good standing, and holds a lease from the Spring Valley water company of the fishing preserves in lakes Pilarcitos, San Andreas and Merced, for which it pays an annual rent of $1,200.

CORRESPONDENCE.

More of the Quartz Mines of Madison County, Montana.

[From our own Correspondent.]

EDITORS PRESS:—There is qnite an excitement at present, and not without reason, in regard to some recent discoveries in gold quartz near the head of Willow creek, six miles above Harrison. I was informed hy Mallory Bros., mill men and mine owners here, and formerly of Gold Rnn, Cal., that not a ton of quartz had been milled, since the location of the mines, that had not paid a profit, and that not a claim, worked to any extent, had not paid a dividend.

The new camp is called Pony, a name savoring on one hand of a safe ride to fortune, hnt, on the other, reminding one a little too much of a "horse" to be altogether pleasing to the miner. Be this as it may, it has only had an existence about three months, and already boasts of a store, two saloons, a blacksmith shop, boarding house, large livery stable and wo 10-stamp mills, in complete running order. One of them is owned by the Mallory Bros., the other by Mr. F. S. Getchell, both being built by Mr. G. H. Sparrell, who is also making preparations to pnt up another on his own account. Including those alluded to, it is thonght that at least a dozen mills will be in operation before the close of another year. Thus far, not a dollar of foreign capital had come in, the principal development being made hy men of limited means, some of them even as poor as one of your San Francisco capitalists once was, when credit conld not be had for a sack of flour. Those best acquainted and most deeply interested, think it the best mining district in the Territory.

After a visit to the mills and a careful examination of some of the leading mines, it may be safely stated that it is as promising as anything met with at the same stage of development.

The Red Mine,

Three miles above the camp, is opened hy a tnnnel 90 feet in length, and a shaft 47 feet in depth. The quartz vein is about four feet in width, and was yielding ore in considerable quantity, that averaged about $60 per ton. Some of it had worked as high as $114 in gold, several hundred tons having been reduced, and apparently an inexhanstible supply in sight. It is owned hy Messrs. Mason, Barnes, Mallory and Moreland.

The Willow Creek,

Owned principally hy the same parties as above (both under the superintendence of Mr. S. J. Sangwin), is opened in three different places, showing from three to eight feet of quartz; the greatest depth 75 feet, with here and there a barren spot; the ore working $30 to $35 per ton. It has yielded about the same amount of quartz as the Red, and, although not producing so much when visited, there was every indication of an approach to a large body of good ore.

The Emeln Mine,

The property of H. H. Hickman, is about 600 feet north of the Willow Creek. An open cut had been made 10 feet wide and six feet deep, cutting a body of quartz eight feet thick, worth from $12 to $15 per ton.

The Boss Tweed,

Belonging to Messrs. Robinson, the discoverer, Mason, Carmin, Dimock, Avery and Getchell, has a lode from 28 to 30 feet of solid quartz, all of which is said to pay for working, running from $10 to $15 per ton, with some assorted as high as $75.

The Belknap.

Lying southwest of the Boss Tweed, and owned hy Messrs. Hickman and Boles, will go about $25 for second class and $60 per ton for first class. The Last Chance, Hickman, Carmin and Sangwin owners, situated on the Boulder slope, 2,000 feet west of the Belknap, runs for third class $12 per ton; second, $25, and first class $100. The White Pine, Mr. Carmin owner, is a very rich but narrow vein from six to 20 inches, with fine specimens of free gold—may be safely estimated to work from $100 to $200 per ton.

The Strawberry,

The property of Messrs. Moreland and Robinson, but with interests segregated, has a shaft 65 feet, a lode from two and a half to six feet wide. The whole of the quartz is worked, and runs from $10 to $100. It is ranked as one of the best paying mines of the district. Adjoining this mine on the south is the Keystone, the property of Mr. Robinson, with a four-foot vein of $20 rock.

The Atlantic and the Pacific, two different claims on the same lode, and owned by Mood & Co., show respectively a width where opened of 18 feet for the former and 70 feet for the latter. It is situated on the divide between Willow creek and South Boulder. Rock from tests estimated at $12.

The Mammoth

Is one of the late discoveries at the South Boulder that has taken its name from its immense proportions, being in the neighborhood of 250 feet from wall to wall, mostly quartz. It prospects from $6 to $75, with some strata going as high as $200 per ton. Much is anticipated from this and other mines in this vicinity the coming season, and many think that this and others of the district will prove fully as valuable as that near Pony. This large lode belongs to Howe, Hughes & Co.

The Etna mine, four miles above Pony, the property of L. W. Woodruff & Co., is said to be nine feet in width and to prospect fully as well as the ore taken from the Willow Creek mine and to be in all respects similar. The Custer mine, belonging to Boyer Bros., is also a nine foot lode, average tests giving an assay value of from $7 to $8 per ton. The Banta, lying between Pony and Sterling, has been yielding $25 per ton, and work will be continued during the winter.

There are four companies engaged in placer mining in Norwegian gulch and all supposed to be doing well, some of them probably more so than formerly, as Mr. P. V. Jackson, of Sterling, who purchases all the gold from the district, has bought double the usual amount the present season. The first placer mine was opened on Hot Spring creek last summer with very encouraging prospects, believed to pay if worked by hydraulic $8 a day to the man.

Hot Spring District,

With camps at Sterling and Red Bluff, was discovered as early as 1865. Very rich surface rock was found. Eastern capital nailed in under the excitement. The old story of California and Nevada was repeated. Costly mills were built before the mines were sufficiently opened to supply them with ore. Probably inexperienced hands were at the bellows. Consequence, failure. It is still believed, if not fully demonstrated, that there are good mines here if properly developed.

Mr. W. R. Reed, who has interest in several leads at Sterling, has put up an arastra and is doing some work, principally with the view of making good his claims. The rock worked the present and past seasons has run from $10 to $40 per ton, the last reduced paying better than usual.

Mr. P. V. Jackson, who now owns the Midas mill and mine, is making preparations to commence developments anew and in earnest the ensuing winter. The mines are represented to be paying better than at any former period, in view of the amount of work performed.

The Red Bluff Mine.

Situated at a place of the same name, the property of Mr. J. J. Lown, paid very well to the depth of 100 feet, where a large body of water was encountered, the ore at that depth being also found rather rebellious, but giving assays in gold as high as $130, the ore containing some silver, lead and antimony. The quartz is from three to five feet and filling the fissures. Like most of the ledges of the district, it lies wholly in the granite. The Boaz paid in early days from $100 to $125. It is not worked at present. A lead that had been abandoned here, is now successfully worked hy Messrs. Hapgood & Goodwin, under the name of the

Centennial Bonanza.

Narrow but rich and said to pay $125 per ton. The Cordwain lode, owned hy J. S. Minnis, at Red Bluff, is from four to five feet wide from wall to wall; the quartz from 20 inches to two feet, and works from $20 to $30.

The Tioga, owned hy Mr. C. P. Bradley, is from three and a half to four feet in width, and all the quartz taken from the shaft, with exception of a little near the surface, was worked, yielding from $15 to $20 per ton.

The Madisonian,

On Meadow creek, 18 miles east of Virginia City and seven miles from Sterling, has an incline shaft 220 feet, probably the deepest in the county, disclosing on the east level a body of ore from eight to nine feet wide, with an average width of four feet for 200 feet on the level. Mr. Daniel Yondee, who purchased the mine a year ago last July, within less than three months, with two men and a shift, took out over 1,200 tons, which averaged $18 per ton. During the last summer over 1,800 tons have been reduced, paying fully as much, from which it will appear that this is among the best paying mines of the county. Owing to want of sufficient pumping machinery, the mine was for a time closed down, but now all things necessary for the successful working of the mine have been received and put in place. Operations have been commenced with one steam five-stamp battery and shaft house, together with a 10-stamp water mill, all complete and in fine running order. This valuable property is owned jointly by D. & D. Yondes. No better wish can be expressed for them than that the future rnne may be as successful as the past.

A. O. K.

THE WEALTH OF WASHOE.—Not a few scientists are of the opinion that great quantities of low-grade ore now thrown into the waste dumps in this city, will eventually be worked. German experts say that there are now being carted into our streets richer ores than many of those that they are working at home. With cheap water and cheap fuel, the "float-rock," the capping of our great leads, will be worked. Hundreds of tons of this rock now lie on the hillsides in this city that will probably eventually be worked at a fair profit, and it is not improbable that some years hence parties will be found who will be willing to take the very dirt from our streets and pay a good price for it, for the precious metals it contains, or at least to bind themselves to leave the streets as good as they found them, for the privilege of working their ores.—*Virginia Enterprise.*

The Morgan Mining Suit.

On November 20th there was filed in the clerk's office of the Nineteenth District Court a complaint in the case of Henry D. Bacon et al. vs. Wm. Irvine, the Morgan mining company, et al. The plaintiffs aver many things of interest to stockholders of the corporation, and set forth the same old story of one man controlling the majority of the stock, electing all the officers of the company, pocketing the earnings and attempting to "freeze out" the minority through the medium of frequent and heavy assessments. A synopsis of the document is herewith published, stripped of legal verbiage:

The Morgan Mining Company.

The mine and mining property owned hy this corporation is situated on Carson hill, Calaveras county, California. It was incorporated with a capital stock of $2,000,000, divided into 20,000 shares of the par value of $100. Wm. Irvine, defendant, owns 11,021 shares, and it is claimed that he has exercised complete control of the property affairs, doings, proceeds, earnings and funds of the corporation; has elected the Board of Directors, whose members implicitly obeyed his directions; that he caused his brother, Robert Irvine, to be appointed Superintendent of the mine, and John Douglass, the brother-in-law of Robert, to be appointed the foreman. William was one of the directors and also Treasurer of the company up to May 5th, 1876, when new deal was given by him, for reasons that will appear hereafter, and he stepped down and out. One of the directors then elected was formerly his partner, another his warm bosom friend, another his attorney, and another his counsellor. It is claimed that this board stand ready to obey Williams' mandates in every particular, even to levying of assessments, whether the same be necessary and proper, or the reverse; they allow said Irvine to direct and manage the affairs of the company, and to dictate to them how they shall act and vote as such directors.

Grave Charges.

Work was stopped at the mine on the 6th of May last. Up to that time the proceeds from the working of the claim—as reported hy Irvine when he ceased to be treasurer—amounted to $2,708.12. Since then the company has realized $6,597.50 from the crushing of certain lots of ores and rich specimens previously extracted. After setting forth this fact, the plaintiffs boldly charge that the two Irvines and Douglass "combined, colluded and confederated together" to fraudulently appropriate and embezzle the proceeds and yield of the Morgan mine. They charge that from statements made under oath by parties who worked in the mine that the gross yield up to May 6th exceeded $100,000; that the directors knew that the treasurer's report made on May 6th, was false; that no attempt was made to compel the guilty parties to account to the company for the funds embezzled and appropriated. From the report made by the directors, May 6th, 1876, it appears (so it is averred in the complaint) that the sum of $22,562 had been realized from two assessments and from the crushing of rich specimens. There was then in the treasury $7,766.69; and no debts were owing by the company, except the expenses for the month of April, amounting to $1,500.

On the 19th of September, 1876, an assessment (the third) of $1 per share was levied, and they proposed to sell the stock upon which the assessment should become delinquent on November 20th, 1876. This assessment was levied, so states the complaint, for the purpose of aiding William Irvine in the fraudulent scheme and plan of selling certain alleged mining ground owned by him to the company at an exorbitant and fraudulent price. He and Robert McMillan own 25 acres of land lying to the eastward of and directly adjoining the Morgan mine; the price asked and proposed to be paid for it was $250,000. Irvine solicited Bacon, one of the plaintiffs, to join him in the scheme, but he declined.

Freezing Out.

It is claimed hy the plaintiffs that Irvine, having this scheme in view, abstained from electing himself a director at the last annual election (May 6th), because it would not look well for him to vote for the purchase of his own property.

C. T. Botts, president, and one of the present directors, stated to a well-known member of the bar of San Francisco that the board intended to purchase a piece of property at a large figure, and that they would "freeze out" all stockholders who failed to pay up the assessment.

It is further claimed that the sale of this property to the company is entirely unnecessary and not needed, and the board of directors were enjoined.

ANOTHER MINERAL DISCOVERY. — Not long since a party of young men, while walking in the Mineral King district, on a prospecting tour, came across an old Mexican drift. One of them said that if ore was taken from the drift it must have been worked close at hand. Search was then made, and soon a large stone was found on top of a limestone ledge, poised upon a pivot, after the manner of the old Chile arastra, so that it could be worked with a lever, and the rock beneath worn perfectly smooth. Mineral fragments were found beneath the rock. For many years parties have been searching our mountains for an old Mexican mine; perhaps it is found at last.—*Tulare Times.*

Opening the Mine.

The following from the *Reese River Reveille* furnishes a practical illustration with reference to our remarks in a recent issue of the PRESS on the "eyes of a mine:" The Manhattan company do not propose to be caught without ore when the breasts from which ore is now being extracted in the various mines are exhausted. A new level is about to be opened at the depth of 560 feet in the Curtis shaft, which is 43 feet perpendicular depth below the lowest ore breasts recently opened in this shaft. This will be commenced with the 517-foot west drift by an incline which will be sunk 75 feet, and which will open up the chimney on the Panamint vein between the 517-foot and 560-foot levels. The shaft will be continued on down to the depth of 600 feet, when another level will be started. At present there is a very large vein in the 517-foot level west drift, which carries good ore all through it. Breasting has already been commenced on this vein and when this connection is made there will be an additional breast opened of 75 feet in depth.

In the Frost shaft a depth of 571 feet has been reached, and a cross-cut from this point to tap the Independence chimney is now in 75 feet, and has yet to go 153 feet to strike it. This will open up another stope of 100 feet in depth between the 500-foot level and 571-foot levels.

The ore bodies in the Curtis and Frost shafts can be said to be barely touched as yet, there being ore enough in sight between the 290 and 500-foot levels of the Frost, and between the 700-foot level of the Bowman and the 517-foot level of the Curtis shaft, to keep the mill running steadily for many months to come. But the policy of the company is to extend their prospecting works to greater depths, while the ore is being taken out of the upper breasts already opened, so that when these breasts are exhausted they have other levels open to commence on, and are never caught without ore. They have never resorted to the ganging system for the purpose of making a big showing in bullion shipments, but always kept reserves ahead, so that it never becomes necessary to shut down the mill for lack of ore. The Panamint vein in the Curtis shaft workings and the Independence vein in the Frost shaft workings can be easily located by survey from depths below those at which they are now worked, and as neither show any indications of the exhaustion of their ore chimneys at the respective depths from which they are now worked, there is no reason to suppose that they do not extend with equal size and richness to the depths at which work is now being done to prospect them, viz., the 560-foot level of the Curtis and 570-foot level of the Frost shaft. The fact of the matter is, that the veins of Lander hill extend to as great a depth as the ingenuity of man can devise to work them, and there will be productive mines in Lander hill as long as mines exist and mining is prosecuted in the State of Nevada.

The Tuolumne Hydraulic Company.

In this mine, at Sullivan's dry arroyo, one mile east of Sonora, steam is being introduced for hoisting purposes, as power enough cannot be obtained with their water works. J. T. McLean, the superintendent, about two months ago recommenced work in this mine, which had been laid over until next season, it being supposed that the winter was too near to alter the system of working. McLean, however, who has been absent in Nevada, thought differently, and with his usual go-ahead, has put the mine in good shape for continued operations. This mine has been exceedingly rich. In 1851, on top, as high as 13 pounds per day have been taken out. After the top was worked off, a ledge of limestone was found covering the claim, and sloping down to a point. Through the center of this a hole was pierced, and gravel found. Twenty feet below, a floor of limestone was struck. The gravel was worked out and found very rich. This chamber, with limestone level floor and sloping roof, had granite walls, which came to a point on the lower side, giving the chamber the shape of a triangle. Through this floor a water worn hole was discovered, which led into a chamber beneath, which has been enlarged by a shaft three feet by 18 inches. This has been carried down below the limestone floor to a depth of 25 feet. The first strata below the floor consists of soft slum, and below this the gravel—very rich. In sinking, the slum crowds in at the rate of two buckets of slum to one of gravel; and to make it a success it became necessary to get power enough to raise the gravel faster—hence, the new steam works. The new gravel deposit, worked thus under such disadvantages, has paid 15 ounces to 24 hours' work—three shafts. How extensive the new deposit is no one can estimate. It only proves what many old miners have often asserted, that rich gravel beds exist under the great fields of lime boulders which extend up through Shaw's Flat and Columbia. If so, untold millions are yet sealed up under these apparently worked-out placers. —*Tuolumne Independent.*

THE BOSS CABLE.—In our account of the combination shaft a few weeks since, mention was made of the boss cable of the Comstock. This cable was manufactured by Hallidie & Co., and is the largest cable ever brought to the Comstock, its total length being 2,900 feet, and its weight 12 tons. It measures seven inches in width and five-eighths of an inch in thickness. It will easily handle 60 tons. It was put upon the reels ready for use last week.

MECHANICAL PROGRESS.

The Influence of Piece Work.

The *Engineering News* is epprehensive that the present prectice in large mechine shops is not favorable for the edncation of master workmen. Where a large contract for machines of eny kind is teken, or a namber of perts have to be msde, she aim is to have as mnch done by the machine tools, and as little by hand as possible, redncing the amonnt of fitting ap to a minimum. For example, in gun work, the parts of one arm are interchangeable with those of another of the same pattera; the same thing is trne with good sewing machines, end in fact with all the artiolss which are produced in qnantity. The forgings as far es possible are made by dies, the drilling and tarning, the planing and shaping ere done on machiace arranged with etops and guides, and tested by gaages, so that no carefal attention is nscessary after the tool is once set. Then the use of milling machines enables one to produce snrfaces more or less irregnlar, which wonld once have been roughed oat as well as finished by the file. Indeed, much of the filing is done when the object ie olamped in a templet or form, so that it mnst be perforce brought to the desired shape.

The ordinary workman then may tend a lathe or planer, or may file at a vise, repeating the same or similar proceeses for months, earning fair wages and turning out an immense amoant of work, as he netnrally acquires a certain amonnt of dexterity in a epecified operation. Even the fitter assembles the same piecea, and goes through the same manipulatioas from day to day in one narrow roand. There is employment for a few mea who sink the dies, make the templates and gauges, lay ont the work in the beginning, and repair such tools as reqnire it. Boys are put at work tending screw and nnt machines or lathes where the operations are entirely mechanical. Where then, among the hundreds of men oftsn employed in our lsrge shops, will yon find a sufficient number of boys who are eo employed as to have any instractioa in the rndiments of a mechinist's trade, or any probable chance of learning the different ways of manipnlating iron, steel and wood, from the raw material to the finished product? A sufficient nnmber, we mean, to replace the men who from time to time retire by reeson of old age or other disebility.

One of the smaller shops, where a considerable variety of work is undertaken, offers mach better facilities for the young learner, but, even here, boys under systematic and definite instruction are not so freqaently to be fonad as is desirable. The system of apprenticeship seems almost to have gone out of vogue. The old fashioned seven years term, which our elders had to serve, and which gave ample time for the pupil to become a thorongh and skilled workman, was mnch too long for oar restless American youths, and even the short period of three years, scanty time as it is for accomplishing aay good result, seems long to the shop boy, when he might be tending a machiae or working at piece work for himself in such establishments as we first referred to.

The paper from which we qaote the above, looke upon good industriel schools as the agency to impart the general mechanical knowledge and skill which is reqaisite to the finished mechanic. That the instraction shall be of the best character, and eminently practical, that the workroom or laboratory shall be side by side with the school and leotnre room, is of course necessary. With care and experience, the attainable results are admirable; indeed, a systematic arrangement of the instruction brings about such a saving of time that the papils will far oatstrip any apprentices in the best arranged shops.

A Powearul Diooino Maohine.—In a railway excavation in Scotland, one of the machines need is an ingenious digger invented by Mr. Milroy, and which, after excavating to a depth of over 90 feet, strnck the rock for the first time. In constrnction, and in the action of its various parts, the digger somewhat resembles an inverted umbrella, except that the connecting bars, repreaenting the rihs of the nmbrella, are swivelled and worked on points at either end. As affording aome idea of the powerful action of the machine at present in use in Glasgow, it may be mentioned that it can grasp within its gigantic "claws" as mnch as three tons of material. It is worked by meane of an engine of 16 horee-power, the chain nsed in the operation being no less than 345 feet in length. The cylinders themselves are immense specimens of foundry work. Aronnd the cylinder, on the inner side, weights have been placed to the extent of 280 tons, the object of arranging thie enormoas mass in such a position being to provide against the probability of the adjacent ground subsiding to a degree which would be highly dangerons. Boulders weighing as much as seven or eight cwt. were brought np by the digger. The clay enconntered in one part was of a consistency similar to india rnbber. This kind of material being encountered to the extent of 50 feet in depth, the difficulty of the task will be readily imagined; and it speaks well for the strength and effioiency of the digger that it has performed its work very satisfactorily, and there hes not been, as far as can be ascertained, a single inch of subsidence since the contractors first oommenced operations.

Makino Mosaics.—The Sevres mosaic works are aboat to be opened to the public. The art of mosaic is young in France. At Rome, where it hes long been nsed in the reproduction of the works of old masters, no less thau 10,000 different shedes of eaamel are kept. At the workshops in Sevres, which are not so developed as those in Rome, there are shelves and drawers fixed parallel to the walls. These draws contain 5,000 or 6,000 tiny cubes of enamel or colored glass, ranged according to tint. The pattern, nsually a peinting, is placed before the artist, who works in a sqaare of cement, in which he lays his cnbes in shades corresponding to the design furnished him. The Romsn artist worke on the seme plan, bat inetead of whole blocks of cement and enamels a centimeter eqnare, they use microscopically emall tnbes, with which they have to work hard to fill up a sqaare centimeter a day. The design is copied with a blacklead pencil on a sarface prepered with white plaster; this is removed little by little, and its place sapplied with cement, in which the fragments of out enamel ere pleced one by one. The finer the shading, the smaller the cubss of enamel.

A Paintino Machine.—Every oae who has had to paint slats or laths or like narrow work knows thet doing so is a tedious and not over easy operation. Plenty of paint is wasted in using a big brash, and to employ a small one is to throw away time. Mr. W. Roberts, of Liverpool, has invented an ingenions little apparatus which performs this work very rapidly and in a mach better meaner than it could be doce by hand. An example of the machine is exhibited at Philadelphia. The paiat is poured into a lower tray. Above are located first a pair of rollers, which seize the slat and draw it in between a series of brushes, one of which paints the apper side, another the lower side, while two more cover the edges. To keep these brnshes wet with paiat two wheels beside the grasping rollers rotate partially in the paint in the tray beneath. These are so grooved as to carry up the liqnid at every revolution, and dash it on the brushes. The machine is said to be capable of painting 6,000 running feet of lath per hour without the aid of steam power.

Winans' Novel Organ.—Mr. Winans, the Baltimore millionaire, who accnmulated an immense fortnne in constructing railroads for the Russian government, is building a novel opera-air orgen at his country seat near Baltimore. Mr. Winens himself is an enthusiastic lover of the musicsl art. The instrument is a large church organ, which is to be located in an octagon shaped building a short distance from Mr. Winaas' residence. The organ building and the residence are connected with a Morse telegraph. The organ building has three large windows with movable blinds, which can be adjnsted by the performer so as to increase and diminish the power of the tones. The pipes are made to speak by the eid of steam power at a pressure three times the ordinary force of the wind. Pnenmatic levers and electric conaections are need to make the touch light. This is one of the last of Mr. Winans' numerous eccentricities.

The Paris Exhibition of 1878.—The plan of the Internetionel exhibition of 1878 has been isened by the minister of commerce. The main building on the Champ de Mars will be 689 meters long by 350 wide. The French eection will occupy the left half of it, and the foreign sections the right. Visitors walking through it transversely will he able to see the "exhibits" of all countries in any particaler class. The fine arts will occupy the centrel avenue, and will have five times the space allotted to them in 1867. The breadth of the avenuee will be one of the most striking features of the building, the area of which will be 240,000 meters, as against 153,000 last time. There will be five departments—namely, mechinery, raw material, furnitnre, clothing and the fine arts. There will be a large hall decorated with statutes at each extremity, one fronting the Trocadero and the other the military school. The plan of the buildings on the right side of the river and of the connecting foot bridge is not yet settled.

Fast Steaming.—A steam yacht has been pnt on Lake Geneva that ran the distence between Geneva and Villeneuve, 43 English miles, in 1h. 48m. 22s., being at the rate of 23.89 English statute miles, or very nearly 20¾ knots per hour. During the first 20 miles a light head wind and some waves were encountered, which reducsd the speed somewhat, but during the remainder of the run the lake was quite smooth. The boiler preseure averaged 100 pounds per sqnare inch, vacuum 24 inches, and the engines made from 309 to 325 revolutions per minute, and developed abou 450 indicated horse-power.

Change for Inventors.—The *Carpet Trade* says: A practical carpet-sewing machine is still an unsolved problem. The attempt very generally made by most of our large retail carpet houses, of sewing their carpets by machines has had to be abandoned in consequence of unsatisfactorily bulky seams. We believe there are not more than two or three machines used at present in the country.

The last number of the *Railroad Gazette* is informed of the completion of 105 miles of new railroad, making 1,875 miles completed in the United States in 1876, against 986 milea reported for the corresponding period in 1875, 1,363 in 1874, 3,075 in 1873 and 5,709 in 1872.

SCIENTIFIC PROGRESS.

What is Phosphorescence?

The phenomenon of phosphorescence has oftea troabled the chemist and the photographer, and there are, no doubt, among our readers some who have, at one time or another, endeavored to obtain reflections of phosphorescence upon the photographic film. We heve never heerd of the attempt proving successful, for the luminosity given off is, after all, eo faint that snch a result is hardly to be expected. We see that a German philosopher has recently been directing his attention to phosphorescence, not from a photographio point of view, however, bnt in order to discover, if possihle, the trne cause of the remarkable pheaomenon. The result of his investigation is thet he is enabled to confirm the conclnsions arrived at by others—such es Hulme, Placidas, Heinrich—who have worked in the same direction. The simpleet mode, so it appeare, of bringing about phosphorescence is to piece mariae fish in a three per cent. solation of salt, and, according to M Pfluger, the phenomenon may he observed the second evening. The lnminosity, M. Pflnger tells us, begins in the eyes, and thence spreads all over the fish, increesing in intensity from day to day, its duration depending upon the temperature. The laminosity is of snch a nature that the fish appears, after a time, to be luminous all through; but this is not the cese, for, on scraping off the surface, it is quite black nnderneath. The luminous matter is, indesd, a kind of slime, which is perfectly appareat in day-light, when it is of a dirty white color; it ie only in the dark that it shines with a phosphorescent luster. It appears that any aaimal matter may be rendered phosphorescent by applying to the surface some of this slime, or, in other words, can be infected by the slime. M. Pfluger has examined the slime under a microscope, end it was fouad to contain a mass of schizomycetes, whioh, from the fact that they moved actively aboat, were doubtless alive. Hence he concindea that the small living cells of the schizomycetes are the luminous agents. The animalculæ, he points out, are not so small that they cannot be filtered from any water in which they may happea to be. M. Pflnger, in his peper, proceeds to give the results of investigation of other deceying matter in which phosphorescence is observed; but we need merely quote the summing up of his conclneions in respect to this mysterious question—nemely, "all phosphorescsnce of decaying organisms is the luminoas respiration of living parasites.—*Photographic News.*

The Last Arctic Expedition.

Thoagh Captain Nares and his colleagnes have f.iled to achieve complete saccess, says *Iron*, there can be no disputing that they have thoroughly deserved it. They fonnd the way to the pole, beyond the atmost northern land, barred by ancient end thick-ribbed ice, over which progress with sledges was impracticable at a greater speed than a mile a day; and there were over 400 miles between them and their goal. The sledging, besides, seems to have been sometimes done under a temperature of 40 degrees below zero. Scnrvy, too—the great bane of northern navigators, against which even preserved meats appear to furnish no remedy—with the lowered vitality and muscnlar weakness it induces, attecked the explorers. The winter's night was prolonged through 142 periods of 24 hours; and when the saa returned to illumine a still longer day, the spirit in the thermometer, for the cold was below the freezing point of mercury, indicated 70 or 80 degrees of frost. The lower deck of the *Alert* was kept, ell throughout the long and savage winter, at a mean temperature of 49 degrees, and that while on the upper deck the air wes 70 degrees below zero. It is now almost certain that the immediate circumpolar region is covered by a shallow sea, and access to the earth's axis blocked by ice fices, practically impassable by all known means of progreesion. If it has thus failed in its first aad most popnlar object, it is satisfactory to learn that the expedition has done excellent work in a really more important direction. Many and weighty observetions in physical science have been made. In geology, miocene strate, entombing a flora and fauna that indicate a comparatively warm temperature at that period, have been traced as far as the existing boundary of animal and vegeteble life; and should it be necessary to repeat or extend investigation at or about the same point, the find of a thick seam of excellent coal close to the winter quarters of the *Discovery*, will prove of great service.

Photographino the Sun.—We learn from *Nature* that Dr. Janssen is devising the construction of an automatic photographic revolver, which will take a photograph of the sun every hour each day of the year from sunrise to sunset. The photographs which will he taken under clondy conditions being useless so far as "sun-spots" are concerned, will be utilized for meteorological purposes; the others being kept and tabalated. The advantage of the plan is that it will dispense with an observer, end will obtain a mechaaical regularity. A communication will be made very shortly to the academy of sciences on the invention, which was suggested by the discussion on the transit of "Vulcan." When completed, it ie proposed to set the instrument at work in the physical observatory of Dr. Janssen.

The Twinkling of the Stars.

The scintillation of stars, and its close connection with changes of weether, hes, as is known, much interested Humboldt, Arago, Kaemtz, Secchi and many othere; and recently it has also been the sabject of valuable spectroscopio researches by M. Respighi. M. Montigny, who some time ego investigated scintillation in relation to the special charaoteristics of the light of different stars, pnblishes in the bulletin of the Belgian Academy, No. 8, en elaborate report upon his researches into the connection existing between scintillation and verious meteorological elements. The chief results, errived at after a discussion of 1,820 observations, mede on 230 days on 70 different stars, are as follows: The intensity of scintillatioa (measured by a special apparatus, the *scintillometre*) increseses invariably with the occurrence or epproach of rainy weather, and with the increase of tension of vepor in the air on one side, and the increase of pressure and decreese of temperatnre on the other, the influence of the two former factors being far more seneible than the combined infinence of the two latter. The scintillation, which is on an average stronger during winter than during sammer, increases with the arrival of moist weather et all seasons. It increases not only on rainy days, but one or two days bsfore, decreasing immediately after the rain has ceased. Moreover, the intensity of scintillation increasss dnring stroag winds, and with the approach of barometrical depressions or *bourrasques*, the increese being most pronounced when the depression passes neer to the observer. It then largely exceeds the average increase corresponding to rainy days; and the influence of great movements in the atmosphere totally coanteracts the contrary influence of a lowering of pressure. M. Montigny ie thas correct in saying that a continued iavestigation of scintillation would be of great service, not only for the prevision of weather, but also for the general study of meteorology, affording a very usefnl means for the exploration of the higher region s of the atmosphere.—*Nature.*

Wool and Hair Under the Microscope.

The *American Naturalist* fnrnishes some interesting facts on this subject. The United States Treasury Department has admitted hair goods free from the dnties levied on those composed in pert of wool; and evidence having been furnished that some fabrics, claimed as made of hair, contained more or less wool, a commission was appointed, in which Dr. J. G. Hunt, the well known microsoopiet, was associated, for the examination of these fabrics. The possibility of distinguishing in manufactured mixture the hair of the cow and calf and that of the sheep has been denied by some microecopists, especially as these fabrics vary on different parts of the same animal. The commission has, however, been able to classify and distinguish them. Wooly hairs have no pith, and no perceptible taper. Their mean diameter varies from a five-hundredth to the thousandth part of an inch. At irregnlar intervals they have one-sided spiral thickenings, causing the wool to curl. They occur on sheep, camels, goats and llamas; and many other animals have a portion of these wooly heirs. On the other hand, straight hairs are shorter, thicker at base and tapering. The pith is a large part. The scales on the outside, of which there are twenty to forty in a hundredth part of an inch, lie smoothly. In wool they project more or less, and are from fifteen to thirty in the hundredth pert of an inch. With these and other distiactions before them, the commission found, by first bleaching the colored fibers in mineral acids, and then moanting them in glycerine, and by usiag high powers, that in a few samples there was no wool; in a larger proportion there was a small quantity; in a very large number of samples there was from five to ten per cent., as well aa a much larger proportion; and in two cases it was difficult to find five per cent. of genuine cow hair.

Science of a Cigar.—The *Scientific American* shows that a cigar contains acetic, formic, butyric, valerio and propionic acids, prussic acid, creosote, and carbolic acid, ammonia, sulphureted hydrogen, pyridine, viridine, picoline, lutidine, collodine, parvoline, coridine and rabidene. "The blue up-curling smoke," which leads the smoker to reverie, contains water in a vaporoas state, soot, carbonic acid and carbonic oxide, and a vaporous substance condensable into oily nicotine. The feathery white ash, which in its cohesion and whiteness is generally considered indicative of a good cigar, yields potash, soda, magnesia, lime, phosphoric acid, sulphuric acid, silica, and chlorine. The ingredients of a poor cigar, a "cabbageora," for instance, is fearful and wonderful to contemplate. An English parliamentary report on adulterations in tobacco gives the following liet: Sugar, alum, lime, flour or meal, rhabarb leaves, saltpeter, fuller's earth, starch, malt commings, chromate of lead, peat moss, molasses, burdock leaves, common salt, endive leaves, lamplaock, gum, red dye, a black dye composed of vegeteble red, iron and liquorice, soraps of newspaper, cinnamon stick, cahbage leaves, and straw (brown) paper. The English, we believe, have a reputation for manufacturing poor cigers. If the foregoing are some of the ingredients, or component parts of their stock, we pity them. With such a formidahle array of "rare chemicals," how can one expect to obtain a good cigar for less then ten cents?

Mining Share Market.

The advance in prices chronicled last week did not hold up this week as was expected, hnt a falling off hes been apparent, as a glance at our stock tahlee will show. On Tuesday an approach to a penio was felt at the informal eesion. At the outset a fnrious attack was made upon the bonanzas, nnder which California was forced down to $48¼ and Con. Virginia to $45⅞. These figures, however, were extreme, and were soon recovered from. The heaviest seller was McKenty, who offered Con. Virginia freely in lots to suit at $46. The regular bonanze supporls did not make themselves particularly prominent during the excitement. Suoh stocks as Ophir, Mexican and Best & Belcher sympathized with the bonanzas, eech falling heavily, and the latter touching $43¼. Justice aleo went off hadly. Before the board met a reaction set in, carrying California to $50 and Con. Virginia to $47, but they did not maintain these figures.

The feature of Wednesday morning's informel eession was a bad break in Ophir end Mexican, which declined to $42¾ and $22⅞ respectively. The honenzas were also off, and sold at very neerly the worst prices of the day previous. Chollar, Hale & Norcroes and Gould & Curry were a shade stronger. Otherwise there were hut small changes.

The manegement of the Niagara mining company have taken a new departnre and have invited the other stockholdere to meet with them at the office of the company, Friday evening, and talk over the sitnation. It seems that the last assessment was only ahout half paid up and the stockholdere have the choice of another aseesement, the olosing down of the mine, or the sale of the stock in the treasury.

The California mine turned out 2,810 tons of ore last week and sent 2,792 tone to the mills. All the ore hreasts continue to look well. The west drift from the C. & C. sheft is in 332 feet, and the ore vein is expected to be reeched ahont the 1et of January. The produot of the Consolidated Virginia mine last week was 2,925 tone, and 2,936 tone were sent to the mills. It will be two weeke before the 1700-foot level in thie mine is opened. The water in the C. & C. shaft continues strong and einking is slow.

Mining Decisions.

The Commissioner of the general land office in Washington, decided in the case of Bntte City, Montana, that patents may issue for town sites in mineral regions, bnt as all mining claime and posessions are by lew exclnded from the operation of patents, the title to them remaine in the United Stetes after a town site patent has been issned; that title to mining oleime can be only acquired nnder the mining act, nnd that patente may isene for mining claims situated within exterior boundariee of a town site, entry or patent. The decision reverses the decision previously rendered by the general land office, thet placer mining claims ocnld not be inclnded within the exterior boundsries of a town site patent.

The commissioner has also decided that in cases of appliostione for patente for mines on the Comstock lode, Nevada, hearings may be had to determine whether the mines in question have heen benefited or drained by the Sntro tunnel; bnt the Commiesioner of the General Land Office will not attempt to interfere with the right of mine owners to exeroise control and ownership over their mines, so long as they comply with the reqnirements of the law.

GEORGE WILSON, administrator of the estate of William Wileon, who was killed six weeks ago hy a falling cable in the Dayton mine, has bronght suit egainst the mine for $100,000 dameges. Deceeeed left a wife and five ohildren. The case came up hefore Jndge Rieing, who, after hearing the argnment on demurrer, sustained the demurrer to the damage claimed for mental distress, hnt ruled that the shift bose should have known the condition of the cable. The eetnal damage euetained will be a matter for a jury to determine.

R. B. WOODWARD, the proprietor of Woodward's gardene, it is eaid, hae inaugnrated negotiations for the purchase of a portion of the Shell Monnd Tract, in Berkeley, where he contemplates removing his gardens end materially enlarging them. The scheme on foot in the Board of Snpervisors to open a new street through the present locality of his gardens at Mission and Fifteenth streets, has impelled him to remove them.

WE cleared 36 wheat cargoes during the first 24 days of the month. The total for the month will probably be not less then 45.

WHAT IS A CAR-LOAD?—Nominally, a carload is 20,000 pounds. It is also 70 barrels of salt, 70 of lime, 90 of flour, 60 of whisky, 200 sacks of flour, 6 corde of soft wood, 18 or 20 heed of cattle, 50 or 60 heed of hogs, 80 to 100 head of sheep, 9,000 feet of eolid boards, 17,000 feet of eiding, 13,000 feet of flooring, 40,000 shingles, one-half lese hard lumber, one-fourth lese of green lumber, one-tenth lese of joist, scantling, and other large timbers, 340 hushels of wheat, 400 corn, 680 of oats, 400 of herley, 360 of flex-seed, 360 of epples, 430 of Irieh potatoes, 360 of eweet potatoes and 1,000 hushels of bran.

THE official *Gazette* at Calontta publishes a minnte of Sir Richard Temple, Lientenent-Governor of Bengal, giving the result of his visit to the districts of southeastern Bengel, whioh were devastated by the last cyclone. The minute confirme the previone estimate that 251,000 persons perished in the cyclone.

THE following are the new trustees of the Kentuok mine: Mark L. McDonald, Frank Swift, T. Day, D. L. McDonald and T. J. Shackelford.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR

Grizzback Mine.—Amador *Ledger*, Nov. 25: This mine at present overshadows all others in the northeastern part of the county. It is in the vicinity of Mace's mill, a few miles above Volcano. The last crushing at Mace's mill averaged in the neighborhood of $100 to the ton. The rock now being taken out ranks among the richest ever seen in the county. Grizzback, the fortunate owner, was working for wages at $2.50 or $3 a day less than a year ago, but, by a sudden stroke of fortune, he has been placed in a condition of comparative wealth. He was offered $15,000 for the claim only a few days ago, which he refused, as he says the rock now in sight will yield at least that amount, without taking cognizance of what may be beyond.

Talisman.—Some weeks ago we recorded the prosecution of pumping operations at this mine with a view to drain the shaft, preparatory to the resumption of active mining. Since then important developments have been made. In grading for a mill site the workmen struck a ledge of great richness. We have not been able to learn the size of the vein, except that it is sufficiently large to raise the most sanguine expectations concerning value. To the north of the main shaft, over which the hoisting works have been erected, the same ledge has also been struck, equally rich. Mining experts, who have inspected the discovery, pronounce it a continuation of the same ore body now being worked in the Keystone. These developments have brought the Talisman into great prominence. It was well known that high grade ore existed in the shaft now being drained, but it was hardly surmised that the ore bodies were so vast as present appearances indicate. Meanwhile, the 10-stamp mill is being pushed ahead. The building is almost finished, ready for the machinery. It is to be run by water power. Sufficient ore might be extracted to keep the mill running steadily if it were completed to-morrow.

The Amador Con., of Sutter creek, has declared another dividend of 25 cents per share.

Montezuma.—Sinking operations were finished on this mine last week. The shaft is now down 150 feet, the ledge maintaining its character for size and richness. Drifting will be commenced north and south next week, the new level to be opened up 140 feet from the surface. Five hundred tons of rock are ready for crushing. One hundred and fifty tons have been hauled to the Kearsing mill, which will be started running immediately. Two hundred tons are to be taken to the Volunteer mill, which will commence crushing at an early date. Should the result of these crushings realize the expectations of the owners, a 10-stamp mill will be erected close to the mine, thereby avoiding the expense of hauling these miles to Jackson.

The Volcano Boers.—The Moyle company made a spurt to commence work on their projected tunnel to drain the Volcano basin. The sound of the hammer is no longer heard, work having been abandoned for reasons to me unknown. Meantime the Volcano gold gravel company, under the excellent management of Colonel Heath, are slowly boring into the heart of the hill.

Mineral Ground.—There is little doubt that quartz equal to any yet discovered exists on the line of the mother lode in the comparatively unprospected mineral country lying between Jackson and the river. The opening up of a paying mine between these points would be a greater stimulus to mining activity than anything else we know of. The ground is soon to be tested, with plenty of capital to back up the enterprise. Work will be commenced at once, and we expect ere long to be able to chronicle cheering news from this hitherto neglected region.

CALAVERAS.

Another Big Clean-Up.—Calaveras *Chronicle*, Nov. 25: This is essentially the era of big "clean-ups" in this section, especially so far as gravel mining is concerned. Several large amounts have lately been taken from the finmes of the various hydraulics in this vicinity, but it was reserved for John Veith, Esq., proprietor of the Excelsior claim on Tunnel ridge, to oversize the piles of dust of all his brethren of the mining fraternity. A run of about two months and a half resulted in the cleaning up of $7,200—a very handsome sum and greatly in excess of expenditures during the run. Mr. Veith has exhibited a good degree of energy and perseverance from the inception of the enterprise that is now proving so profitable, and has encountered and overcome obstacles that would have discouraged almost anybody. The richness and extent of the claim are now so well established that its permanency and value are assured, and Mr. Veith can count with certainty upon ample dividends in the future. $7,200 in two months and a half!

The Emerson Claim.—The work of extending the bedrock tunnel in the Emerson claim, Happy valley, to permit the laying of the flume in close proximity to the gravel bank, is approaching completion. Piping will be resumed as soon as the tunnel is finished with greatly increased facilities for washing.

Duryea Mine.—The debris of the cave that recently occurred in the Duryea mine has been removed and everything is all right again. The mill is running merrily.

Quaker City.—The water is being taken from the Quaker City mine, located near the Junction. It is not decided yet, we believe, whether work will be resumed in the mine or not.

New Hydraulic.—W. W. Cook, of this place, the well known hydraulicist, is about opening a new claim a short distance above Rich Gulch flat. A portion of the iron pipe to be used in connection with the claim passed through the town this week. It is expected to have the new enterprise in full operation in a few days.

Boston.—Favorable progress is being made at the Boston, near Buckeye. The mill is kept running with good results, although its crushing capacity is not so great as was claimed for it by its builders. The rock pays well, a recent clean-up considerably exceeding the expectations of the gentlemen owning the mine. A tunnel is being run into the hill, on the ledge. The vein shows well, so far as uncovered, and in fact the prospects of the mine are altogether encouraging.

INYO.

The Monoo.—Inyo *Independent*, Nov. 18: Agent Cowles, of the Cerro Gordo freighting company, informs us that the Modoc company have already shipped on the company's teams no less than 5,000 bars of bullion, the product of their two furnaces at Lookout, although they have been running but a few weeks. This bullion is said to be worth over $400 per ton on the average.

Lookout.—Cosо *Mining News*, Nov. 25: From a very reliable party from Lookout we learn that the Minnietta road to connect with the Panamint Valley road is completed beyond the point selected for the mill, and the work of grading the mill site was commenced Wednesday last. The Cerro Gordo freighting company's teams with the machinery of the Snnlse mill are expected to-day, and the erection of the mill will be begun at once. The road to the Minnietta ore dumps is being continued with a strong force, and will be completed in about ten days. Full supplies of lumber for the ore shutes have arrived. The mines are looking well at all points. Pipes to conduct the water from Snow's canyon to the mines is now on the road. Surveying parties have gone across Panamint valley to bring in a road from Wild Rose, over which will be transported coal and timber supplies; they will also bring in water from Narbee canyon for the accommodation of the Lookout country generally. Work has been commenced on the Little Mack mine, and the tunnel contracted for is being driven rapidly ahead, running directly upon ore, the face of tunnel looking extremely well, exceeding expectations of all who examined the property previous to much work having been done. From all appearances at present there is a grand future for the Lookout country.

MARIPOSA.

Operations on the Estate.—Mariposa *Gazette*, Nov. 18: We had the pleasure of a call at our office to-day by Mr. E. G. Burr, agent of the Mariposa land and mining company, and Mr. Wolberg, of the firm of Wolberg & Co., New York city. Mr. Wolberg is a stockholder of the company, and is here with a view of seeing for himself the landed estate and the extensive mines and mining operations thereon, which have given this estate a world-wide celebrity. From intimations received from these gentlemen, we believe the axle upon which the "Los Mariposas" grant stands is going to be lubricated with a will and determination of its owners that will revolutionize the business aspect of our county. The force at the river tunnel is soon to be doubled, and extensive machinery wherewith to drive the tunnel at much greater speed is soon to arrive. A shaft is to be sunk immediately upon the Pine Tree vein to the depth and level of the approaching tunnel. The Princeton and Mariposa mines are under consideration by the company. Operations in these valuable mines are expected soon to commence, on which a great amount of money is to be expended. Sunshine and prosperity is close to our doors. Let us be patient a little while longer, and all will be well with us.

MONO.

The Mines.—Cor. Inyo *Independent*, Nov. 18: The mines never looked better than at present. The Diana company has completed its hoisting works and is now sinking on the ledge, besides working about 30 men, who are taking out ore from all parts of the mine. The Kearsarge people have been engaged upon improvements so far, but are now ready to go ahead with mining operations, with every prospect of substantial developments. Various other mines, almost too numerous to mention, are turning out tons of the best black metallic substance, and the day is certainly not far distant when Benton will rank among the first mining towns on the Pacific slope—a rank gained entirely upon her own merit.

NEVADA.

Yuba.—*Foothill Tidings*, Nov. 25: The new 25-stamp mill of this mine started up last week, Wednesday, under very favorable auspices. The mine is sufficiently opened, it is thought, to keep the mill running without difficulty and on a fair grade of rock, which will, without doubt, soon turn this enterprise into a regular dividend payer.

Homewaen Bound.—News from this mine is very encouraging. The south drift shows a large ledge of good looking quartz, which is heavily charged with sulphurets and shows some free gold. The north stopes are turning out well, and a large pile of quartz now on the dump will be sent to the mill immediately. The general opinion of those who have examined this mine is that she hids fair to make one of the big mines of the district.

The Godfrey, a gravel mining enterprise on Alta hill, is down to the bedrock with its main shaft, and will soon have sump made, pump set and everything ready for drifting and taking out gravel.

Gravel mining is receiving renewed attention in all parts of the county of late. The big enterprises at North Bloomfield and at Blue Tent, in opening up the main channels of our ancient river beds and proving their richness, have given an impetus to this class of mining, and the Gold Spring company, near Nevada City, is, we learn, about to enter the list of paying mines. On and about Alta hill, near this place, are several new gravel mining enterprises, some of which are likely to give a good account of themselves soon. There's many a million dollars in gold lying in the Alta channel and its various tributaries, without a doubt, and persevering work will bring it to light.

Osceola.—New Mill.—We learn this week that a new mill and hoisting rig is to be put up at once on the Osceola mine, situated over on Squirrel creek, a couple of miles or so west of town. Over 20 years ago the Osceola ledge was prospected by E. W. Roberts and others, and a very rich pocket found, which turned out several thousand dollars' worth of solid specimens, besides several loads of rock, which, worked by mill process, gave a return of $225 per ton. Upon this San Francisco capitalists bought up a controlling interest in the mine, a 24-stamp mill was built, and, as the main body of the ledge failed to pay over $10 per ton in the crude mills then in use, and no other rich pocket was found—indeed no search was made for any, except by tunnel straight ahead into the hill—further operations were suspended, the machinery sold and taken away and the mine sold for debt. Ten years later Tew & Morgan became the owners of the mine and proceeded to open it up, but so far as we can learn the trouble has always been that though rich enough in the precious metals to pay—as shown by average assays of the rock—there was too large an admixture of copper sulphurets for ordinary mills to work. It is to be hoped that the present proprietors will proceed in a proper manner in the erection of the new mill, and that the Osceola may be made to yield up her ample treasures.

PLACER.

Mining Items.—Dutch Flat *Forum*, Nov. 23: The continued pleasant weather has afforded our miners an opportunity to push forward with their outside work, and they have taken advantage of it with a will.

Our ditches are running but little water. The South Yuba has about 1,200 inches, and the Miners' Ditch and Cedar Creek Co. about 400 inches each, all of which, however, is being utilized to the best advantage.

The Baker claim commenced washing through its shaft into the Yankee tunnel last Saturday, running water for a few hours on that day, and also each day since then. There is quite a strip of drifted ground, which must be removed by washing at odd spells, before the solid gravel can be reached, when continuous washing can be carried on. Opening a new claim is slow work, but in this one the superintendent has run an incline from the shaft to the rim rock, and has so arranged that the rocks removed by the derrick can from the start be thrown back out of the way, thus affording unusual advantages for opening. It will require about a month or six weeks' washing before the solid gravel that can be blasted is reached, after which time we shall expect big things of this claim.

The Elmore Hill, Southern Cross, Polar Star and Central claims continue washing at about the same rate as last week.

The Franklin and Summersett claims are being put in first-class order, and will both be ready for washing in a short time.

At Gold Run the North Star claim, belonging to the Miners' Ditch Co., has started up since our last issue. The Hoskin claim continues washing.

The Indiana Hill and Cedar claims are being put in working order as fast as possible, and everything in this district is in a very promising condition.

Yost Bet Mines.—The Nevada Hydraulic Mining Co., an extensive gravel mine, owned by Alvinza Hayward, of San Francisco, and run under the supervision of David Rose, embraces over 600 acres of mining ground, having an average depth of from 100 to 350 feet of gravel, is now fitted up to wash at four different points as soon as sufficient water can be had. They are running two streams of water at present, and have made two partial clean-ups, recently, with satisfactory results. The contract for running a bedrock tunnel, nine feet square and 2,000 feet in length, from Wilcox ravine, to tap the channel in this mine, was let to J. H. Bugbee, of San Francisco. He has over 200 feet completed, and is running three shifts per day. The contractor talks of having improved machinery erected in a short time, for hurrying its completion.

The Neece & West mine turned off the water about a month ago, and have since been busy making extensive preparations for the coming season, in running bedrock cuts, extending pipes and putting in new flumes. The work will be completed in about a week, when water will be turned on and washing resumed.

At the Waloopa mine the work of running a bedrock tunnel, 300 feet in length, is progressing rapidly and will be completed in one month, when the raising of a shaft and putting in new flumes will be commenced. They do not expect to be ready to do any washing in this mine for about two months yet.

The Red Dog mine being already fitted up for washing, the principal work being done at present is running powder drifts, which will be charged and exploded as soon as water can be had to wash.

PLUMAS.

New Company.—Pinmas *National*, Nov. 18: Last week we spoke of a foiaim having been located by a "gold finder," on the ridge north of Spanish ranch. We have since been informed that a company has been made up and operations will soon commence on a tunnel to open the channel. The tunnel will be 800 feet in length—mostly bedrock. Shares in the amount of $2,000 have already been taken. Many experienced miners have long predicted that the channel was rich, and we would not be surprised if the new company would strike it big.

Quartz Mine Discovered.—A short time since, Mr. Kline, of Taylorville, discovered a quartz ledge on Montgomery creek, a few miles east of Taylorville, which prospects well, and assays made show that the rock is worth about $60 per ton in gold. A company has been formed to open the mine, and work is already commenced. The strike created considerable excitement in Taylorville and extensions were taken up and locations made which cover nearly all the ground in the vicinity of the new discovery.

Eureka Contracts.—Last week the Eureka company let their contracts for wood, coal, timbers, spiling, etc., and the bidding was spirited. Mr. Meylert, of this place, got the wood contract for two years at $4.37½ per cord. W. W. Yeates got the contract for coal, timbers and spiling. The work of getting in the supplies for the present winter is about through.

SIERRA.

North Fork.—*Mountain Messenger*, Nov. 25: We visited Forest City a few days since and were somewhat surprised at the amount of work being done by the North Fork mining company. They have quite an extensive timber shed erected, and workmen are busy putting in place the timbers for a large dump about 300 feet long. Above the dump a large reservoir is being constructed by hlasting in the solid cement, principally. A flume is already finished to carry the water of the North Fork to the works. The company contracted for, and have on the way some 4,000 or 5,000 pounds of "T" rail, weighing 12 pounds to the yard. This company is spending a great deal of money and it all has to come out of the pockets of the stockholders as it is not in a position to take out any money, though a large body of paying gravel has been prospected. They still have about 800 feet of tunnel to run in new ground to get their works open in good shape. They hope to have everything in good working order by the time water comes in the spring.

Exchange Co.—David E. Williams, one-third owner in this claim, after much trouble and expense, has at last recovered all of his interest in the mine, and the owners will now proceed to put the property in first-class working order. They have recently struck an excellent body of gravel and the mine bids fair to prove one of the best in the county. It will be recollected that Mr. Williams sold his interest several years ago for $6,000, but by default of purchaser he was compelled to recover the mine at the end of a law suit.

La Porte.—This mining burg has yielded an immense amount of gold this year, with promise of doing as well next season, if there is anything like a good supply of water.

Strauck Gravel.—The Pioneer company at Grass Flat, near Port Wine, have struck gravel in their tunnel, but as to its richness we have not yet ascertained.

China Mining.—A China company is putting a wheel in the river just below our office to work the lot formerly owned by H. Spaulding.

Howland Flat.—Hunter's company are in light colored lava, and their tunnel is in about 1,500 feet, with 300 more to run before striking pay gravel.

Port Wine.—Monte Cristo mine, owned by M. Wolff, J. Robinson and C. Doray, is paying well. Most other claims here, only wages.

Gibsonville.—This old and historic mining camp now bids fair to equal if not eclipse the modern glory of our far-famed Forest City. The numerous mines there are yielding large returns this season, and the population is steadily increasing.

Soales' Diggings.—The noted mining camp is flourishing, with bright promise for the future. Large amounts of capital are now invested here, with every indication of bringing forth heavy interest to its lucky owners. Cleaveland & Siems hydraulic company are fixing up for winter, with fair prospects ahead; are rebuilding a reservoir, washed out two years ago, now nearly completed. Boyce Bros. have everything in good shape for water season, and are now employing about 15 men in their diggings. Union Hill company have been running a tunnel and cut in their mine, and raising out and blasting up their ground for the season, so as to be ready for the first rains. Poverty Hill claims are now all consolidated, and ready to be worked this season. They are now owned by San Francisco capitalists.

TRINITY.

Weaver Creek Flume.—Trinity *Journal*, Nov. 25: Only a few boxes will be added to this flume the present year, owing to the fact that the bed of the creek has to be left and the channel in which the flume will be set cut through solid bedrock a depth varying from 10 to 15 or more feet. This is made necessary by the main channel of the creek being so crooked that it would be difficult to make a flume follow its tortuous windings. A force of men have been employed steady for some weeks cutting through the rocky point, and they have probably broke into the channel of the creek above by this time. Another season's work will bring this enterprise into an excellent shape.

Miners hereabouts have very little water at present. Some of the claims manage to run about two hours a day.

TUOLUMNE.

Mining Accident near Columbia.—Tuolumne *Independent*, Nov. 25: On Wednesday, Nov. 22d, while Frank Sylva was engaged in digging a race across the lane leading from the Gold Spring road to Gen. Winchester's, a boulder, weighing probably half a ton, fell from the bank upon him, crushing and bruising his head and fracturing the skull back of the left ear.

We understand that a large portion of the Philadelphia gravel diggings have been sold to a San Francisco company for $10,000 cash.

VENTURA.

Petroleum Interests.—Ventura *Free Press*, Nov. 25: Oil interests are still looking upward, and the production is much greater than the demand. The big well of Adams, Thayer & Co. is producing about 60 barrels a day, and their other three wells are yielding about 20 barrels, while their tunnels, of which there are several, are producing about the same amount—making the aggregate production about 100 barrels per day. Of this amount the refinery here uses about 80 barrels a day, and outside parties, including several gas companies, are using about 15 barrels daily. The remainder of the production goes to waste, pending the enlargement of the refinery. Adams, Thayer & Co. have a lease of all the oil on the Ex-Mission lands for the term of 10 years, and claim that they can at any time increase their production to several hundred barrels a day, if necessary.

Nevada.

EUREKA DISTRICT.

Knocked Off.—Several miners have been recently discharged from the Eureka Consolidated mine. Superintendent Donnelly informs us, however, that the mine will be worked as usual during the winter.

New Superintendent.—R. W. Tully, of Nevada City, is among the recent arrivals from the west. He comes among us to locate permanently, having accepted the superintendency of the Geddes & Bertrand mine. We met Mr. Tully for the first time yesterday and found him to be a very clever gentleman. We welcome him to the Base Range and hope that his stay among us may be both pleasant and profitable.

HIGHLAND DISTRICT.

The Furnace.—Pioche *Record*, Nov. 22: From parties just in from Highland we learn that the furnace enterprise at that place is an assured success, that there is no doubt of it. The men employed are all old furnace men, and to judge from their deportment and general good spirits, if from nothing else, would be sufficient to inspire almost any one with confidence in the ultimate success of the enterprise. A supply of coal is all that is wanted to again start the furnace, which want will soon be supplied. It is of 20 tons capacity and when once under way, with a good supply of coal on hand, bullion will be turned out at a lively rate.

LAKE DISTRICT.

Mastodon.—Ward *Miner*, Nov. 20: From W. Crary, superintendent of the Mastodon mining company, in Lake district, we learn the following: This is a company of San Francisco capitalists organized for the purpose of developing this mine. There are 300,000 shares in the four mines. They started a tunnel in 1873 to tap the vein 200 feet below the surface. After getting in 25 feet struck a large cave; passed through this chamber of decomposed quartz and came to a lime rock formation; went 30 feet and passed through a quartz ledge 18 feet wide, then struck another cave about 50 feet in width. The distance to the main ledge is probably 70 feet further east. It is said to be free milling ore. They have been working under great disadvantage during the past three years, but are now firmly fixed. The ledge runs northwest and southeast and pitches to the east. While running the tunnel ore was found which assayed over $300 to the ton in silver. The croppings have assayed as high as $2,800 in silver and $252 in gold. Seven men are at work in the tunnel night and day, averaging from three to four feet every 24 hours. It is a slate rock formation on the east wall, and on the west wall, where the tunnel is being run, is lime. This company have secured water privileges and mill sites by U. S. patents and also patents to their four mines. The camp is abundantly supplied with wood and water. A road to White River valley is completed, passable for light teams, built last year by J. Ragsdale and other enterprising citizens of this county. Forty or fifty other locations in that district and on the surface of some of them paying rock has been found. This look substantial. This district joins us on the west.

LEEDS DISTRICT.

Watee.—Pioche *Record*, Nov. 24: We learn from parties just in from Leeds mining district that the owners of mines in that section are bound to have trouble in making the developments in their mines on account of water coming in on them. One mine that has already reached the depth of 55 feet is flooded so that work had to be suspended before going deeper, the owners contenting themselves with ohioriding above that level. The Virgin river flows near, and it is probable that other mines will meet with the same difficulty, and to work them it will require expensive pumping machinery. There is no travel now from any direction except from Pioche, and the only excitement is in Pioche in regard to the mines of Leeds district. There is no excitement there on the ground. A few houses are going up and only a few. There is no money in the country at present, and not likely to be until the mill is hauled down there and put up and gets to work. Miners that are now in that section with a view of prospecting find that the best chances have been located for a distance of 2 miles, and that there is no chance to get in on any of the locations except by jumping, which will eventually entail a lawsuit.

TUSCARORA DISTRICT.

Strike.—Elko *Independent*, Nov. 18: Justice Meacham has discovered the richest kind of gold diggings about half a mile west of the town of Tuscarora. The gold is free, and is found in what appears to be porphyry. The Chinese have been engaged in surface mining in the vicinity for several years, and the supposition is that there is a rich gold-bearing lead in the immediate vicinity.

WARD DISTRICT.

Running.—Ward *Miner*, Nov. 20: The furnace is running night and day, turning out from four to five tons of bullion per day. 1,350 bushels of charcoal used in a day, which costs 27 cents per bushel, and will continue to pay that sum until the 1st of March. There arrives 20 tons of ore per day from the Paymaster and 35 to 40 tons from the Defiance.

WASHOE DISTRICT.

Bullion.—Gold Hill *News*, Nov. 29: The main north drift and east cross-cuts on the 1400-ft level afford no new features whatever. The face of all the drifts on that level are in soft porphyry and ledge matter. The face of the south drift, on the 1500-ft level, is showing a fine character of lively quartz, with every indication of a large concentrated body in that portion of the mine. The north drift on the 1500-ft level being run for the double purpose of ventilation and prospecting the ledge, will in all probability complete a connection with the north winze to-day. The men in the opposite drifts were so near each other last evening that they could converse with each other with ease, so that the connection cannot long be delayed. The north drift on the 1700-ft level is steadily advancing, following the west wall of the ledge, and shows no important changes during the week. The porphyry in the face of the north drift, on the 2000-ft level, running through the Alpha ground, is becoming softer and carries streaks of quartz of a very lively character. The ventilation of the mine is gradually improving in every part. No trouble whatever has been experienced with the ventilation in the north drift on the 2000-ft level.

Con. Virginia.—Daily yield, 400 tons of ore. The ore breasts on every level from the 1400 down to the 1550-ft level are yielding rich ore and looking well at all points. There has been no delay with the mills for this month, and the yield of bullion up to the present time is over $100,000 in excess of that of last month at the same date. The final clean-up at the close of the month will probably increase the returns another $100,000 or more. We can add nothing to our former reports of the extent and richness of the ore on the lower levels. The west drift on the 1650-ft level of the C. and C. shaft is in a distance of 335 feet, the face in good running ground. With reasonable success this drift will reach the ore vein by or before the last day of December next. The north drift on the 1700-ft level has been put in the best of repair and is again advancing at a steady pace on the northward.

California.—Daily yield, 400 tons of ore, keeping the mills all running up to their full crushing capacities. The ore breasts are showing splendidly at all points. The yield of rich ore from the 1400-ft level is steadily on the increase as the stopes advance to the northward. On the 1500, 1550 and 1600-ft levels the ore stopes never appeared better or gave better promise for the fu-

The Engineer.

The North Sea Canal.

This great engineering work, which, next to the Suez canal, is the largest undertaking of its kind in the world, was opened on Wednesday last by the king of Holland. Hitherto the only way to Amsterdam for vessels of more than five-feet draft was the North Holland canal, connecting that town with the Helder, or Nieuwe Diep. It was constructed in the reign of William I., is 51 miles long, very tortuous and narrow, and only available for vessels drawing 16 feet of water. The idea of joining Amsterdam with the sea by a direct communication had long been entertained and investigated by various committees, and though many were incredulous of its ever being possible to carry out such a work, a concession was given in 1861. In 1863 a company was formed, and in 1865 the well known firm of contractors, Messrs. Henry Lee & Sons, of Westminster, undertook the execution of the entire work for a sum not far short of £2,500,000 sterling.

Our English exchange, *Iron*, describes the new work as follows: This great enterprise may be said to consist of three parts: I. The shutting out of the tidal waters of the Zuyder Zee from the Lake Y (pron. I), situated to the west of Amsterdam. 2. The making of the canal proper. 3. The making of a harbor on the shore of the North sea at the entrance of the canal. The first part was executed by Messrs. Lee, in conjunction with and under the management of Mr. T. C. Watson, M. I. C. E., and to his ability and vigilance is due the successful completion of this part of the work in 1872. It consists of a sea-dyke, cutting off the waters of the Zuyder Zee to the east of Amsterdam, which is intercepted by large locks having three basins and a pumping station containing three powerful pumps. The sea-dyke is admitted to be the finest of its kind in the kingdom. The engines and pumps, constructed by Messrs. Eastons & Anderson, are the largest in Holland, being each 75-horse power, and discharging together over 74,000 cubic feet of water per minute.

The second part was in the hands of the late Mr. S. Freeman, M. I. C. E., but its completion is now intrusted to Mr. Watson. It consists of cutting the canal through the sand-hills or dunes near the North sea, and of the construction there of large locks with two basins, the bigger one being able to accommodate vessels 390 feet long, 59 feet wide, and drawing 27 feet of water. Nearly 8,000,000 cubic yards of sand have been removed from this part of the canal alone. It then passes through the Lake Y, where banks had to be made on each side and the channel dredged to its proper depth. This was done by Mr. Freeman in a very ingenious and quite novel way, by attaching centrifugal pumps to bucket dredgers, and by their means passing the sand through pipes to a distance sometimes of 400 yards and more. Five million cubic yards of dredging had to be done in this part originally, but on account of the company being continually called upon to sluice off the water by the North sea locks to prevent the flooding of Amsterdam, siltage was brought into the canal to the extent of nearly 3,000,000 cubic yards. The land on each side of the canal has been reclaimed and has fetched enormously high prices, amounting in some cases to £120 an acre. There are nearly 12,500 acres of reclaimed land, and by the concession they become the property of the company. The canal will, when fully completed, be 23 feet deep, 20 yards wide at bottom, and have a varying width of from 70 to 130 yards. Its length is 16 miles.

Mr. Darnton Hutton, M. I. C. E., has charge of the third portion, which consists of making a harbor on the coast at the entrance of the canal. This harbor is situated just half-way between the Hock van Holland (entrance into Rotterdam) and the Helder, or Nieuwe Diep, which are nearly 100 miles apart, and will form the only refuge for vessels between these two places along this barren and sandy coast. The canal and harbor were already so far advanced in the latter part of September as to allow of the passage of the iron-clad turret ship *Koning der Niederlanden*, the largest and most recent addition to the Dutch navy. Since then many other steamers and yachts have passed out of Amsterdam this way. This extensive work was planned by Sir John Hawkshaw. He and Mr. Waldorp are the consulting engineers for the company, and Mr. Dirks is the resident chief-engineer. Trade having been greatly on the decline of late years, the opening of this new waterway has raised great expectations in the mercantile community of Amsterdam, and great preparations were made for the due celebration of this important event.

Suez Canal.—The filling up of the Suez canal is an event that may now be considered indefinitely postponed. Last year between the two seas only 52,700 cubic meters of "stuff" were removed, and the canal was navigated with facility by steamers drawing as much as 27 feet, and over 400 feet in length. The bed of salt which forms the bottom of the Bitter lakes is gradually dissolving, so that this portion of the canal is being gradually but steadily improved, and with the increase of vegetation along the banks of the canal, there is a prospect of the production, in a not distant future, of a fertile and populous tract of country, out of a sandy waste.—*Journal of the Franklin Institute.*

The Eads Jetties System.

Chief Engineer James B. Eads, in the conclusion of his report, sums up the work thus far done on the jetties at the mouth of the Mississippi river as follows:

In 17 months after the passage of the act, and within 14 months from the commencement of the work, the jetties have solved the problem presented at the mouth of the river. In their unfinished condition they have withstood with but trifling injury two very severe storms, one surpassing in violence any known in that locality for many years; they have demonstrated the entire ability of the delta formation to safely sustain the works necessary to control the river discharge; they have not been overturned by mud lumps, nor swallowed up by quicksands, nor undermined by the river current; and although largely over 3,000,000 cubic yards of earth have been swept out from between them into the gulf, and the channel across the river has been deepened from eight or nine to 21 feet, no evidences of a re-formation of the bar have yet occurred to justify the belief that any extension of them will be necessary.

The resident engineer at the Mississippi jetties has reported to Mr. Eads, who is now in St. Louis, that the shoal above the head of South pass is rapidly disappearing in the channel, and claims that it is now evident that whatever volume of water is required in the pass will be completely under control. The submarine sill between the parallel dykes which form the entrance will be finished this week. The St. Louis *Globe-Democrat* predicts that within a few weeks the river will be thoroughly harnessed, and the commerce of the Mississippi valley opened to the world.

Railway up Mount Washington.—Taking the train for the Fabyan house at 7:20, we leave the cars at the Mount Pleasant house, prepared to walk to the base, there to take the Mount Washington railway to the summit. There are two routes to the base—one by a turnpike, and the other by the Mount Washington extension, six miles in length. This was opened early in July, and has been in successful operation since. This road, for the last half, carries the heaviest grade of any common railway—no less than 290 feet to the mile in the steepest parts. An engine built for the route, and a very light observation and baggage car, compose the trains. I never before realized any up-hill when walking a railroad, but it is quite noticeable here. Great credit is due Superintendent Dodge, of the Boston, Concord and Montreal railroad, for his energy in completing this road, so that passengers can now have uninterrupted rail communication between Boston and the summit of Mount Washington.

After a brisk walk of an hour and a half I have "covered" the extension and reached the proper mountain railway with its peculiar center rail. In regard to this rail I should like to correct an impression that may exist in the minds of some, as it did in mine until I saw the road face to face. Instead of the broad circumference of an ordinary flat cog-wheel straightened out, the rail better resembles a long, serpentine iron ladder, with strong rounds one and a half inches in diameter and four inches apart from center to center. Into these spaces the stout center cog-wheel of the locomotive plays—thus carefully clawing its way to the top without accident.

New Map.—The United States Centennial map has just been placed in the west end of the government building. It was prepared for the exhibition at the general land office, and is 17 feet in hight by 22 feet in length, and divided into nine sections, each mounted on a separate stretcher. The whole is enclosed in a massive frame of walnut, bird's-eye maple and ebony, and weighs 2,000 pounds. It shows the extent of all surveys, Indian and military reservations, land grants, railroads, canals, cities, and towns, and, in fact, every possible detail, from the most authentic sources.

St. Anthony Falls.—The government works undertaken for the protection of the Falls of St. Anthony will be completed about the middle of this month. The immense wall of solid concrete, which is to prevent the water from percolating the sand-rock and undermining the limestone ledge, is nearly finished. This wall is 1,875 feet long, extending across the river and running underneath the bank on each side. It is 40 feet high, 7 feet thick at the base and 4 feet thick at the top, where it connects with the ledge over which the waters of the Mississippi pluuge.

Kennebec River.—In the Kennebec river an engineering work for the improvement of navigation is going on, which is somewhat similar, though upon a smaller scale, than that at Hell Gate. "Dry Dock," near Richmond, is being removed under the direction of General Thom. In the neighborhood of this rock there is a strong tidal current. In one blast recently there were four holes drilled, 17 feet deep, and filled with vulcan powder. The mine was exploded by means of a battery, and the discharge was satisfactory.

An assay was yesterday made of some debris thrown up in excavating for the new Main street sewer in Gold Hill. The result was: Gold, $4.06; silver, $7.54; total, $11.60 per ton. The sample was picked up at random, without selection.—*Virginia (Nev.) Enterprise.*

Golden Gate Park.

During the week we enjoyed a ride to the Golden Gate park with Hon. William Alvord, a member of the park commission. We take particular interest in the progress of this enterprise because it affords city people a much needed opportunity for recreation among scenes of natural beauty, and because the commissioners, in their efforts to transform the sand dunes upon which the park is laid into groves of trees and sodded slopes, are solving questions of much practical importance in many of our coast counties.

The ride over the sounding roadways of the park shows what an excellent material the red shale is for road making in pleasure grounds and private landscape gardening in localities where water can be had for sprinkling the road. We are familiar with this red shale road from memories of one of the handsomest college grounds in the East, the campus of Hamilton college. It affords a most pleasant contrast with the green of the trees and sward, and does not tire the eyes beneath full sunshine as does a glaring white roadway. The commissioners have this material in abundance within their own lands, and it is a fortunate possession in the way they have used it.

A view of the park shows that the commission is achieving general success in their efforts in reclaiming the sands. They are greatly crippled in their work from lack of funds, and the work of propagating and setting proper trees and plants, which should now be pushed rapidly, is almost arrested by the withholding of needed money. This seems unwise, because a year of propagating and planting, now in the infancy of the undertaking, will be worth ten in the future, so far as the enjoyment of the park by the present generation is concerned. But, notwithstanding the limits which are placed upon present work, the growth which is being attained shows the wisdom of past efforts. One thing is demonstrated, and that is that when the transfer of property was made by which the city gained the title to the park, there was a richer inheritance gained than those who transferred it thought. The drifting sands are found to foster growth of tree and shrub and plant far better than was anticipated. The lupine, which was freely sown, obtained a good rooting, and a good idea of its progress can be had by contrasting the area of the park with the sand fields on either side, which have been left without efforts to reclaim. The shrub takes eager possession, branching low, and single plants are soon transformed into low mounds of verdure, effectually anchoring the loose sands beneath the circles. The lupine, although, of course, less handsome than smooth, swelling curves of green sward, still gives a pleasant color to the dunes and banishes the "barren wasteness," which is their normal characteristic. Besides the lupine there are other plants and shrubs which are being introduced, and many of them show signs of success.

Commissioner Alvord looks upon the reclamation of the sand dunes as the salvation of the city from the drifting sands which were rapidly progressing across the peninsula from the ocean to the bay. The tendency of the sands inward is easily demonstrated by observation, and it is indeed a salutary fact that the combat of the city with the sand should be conducted by the commissioners on the edge of the ocean instead of forcing future generations to fight it on our streets. We have spoken of the edge of the ocean; at this point the commissioners are now disputing the ground with the mild but persistent Pacific. They are constructing three lines of high brush fence, in parallel lines, above mark of high tide, and after thus inducing nature to raise barriers against itself they will build roadways upon the natural embankments and turn sea walls into boulevards. This is a very interesting feature of the present work of the commission, and its ultimate success is very desirable.

We were particularly interested in the growths, aside from lupine, which the commission are securing upon the sands. Some parts, under cover of trees and eminences which break the sand drift, are covered with a perfect sod, shorn like a lawn and beautiful with thickly matted grasses. Trees are succeeding admirably: acacias are in bloom and vigorous growth, pines and cypress and the different sorts of eucalyptus are thriving. In some favorable locations the trees have attained of 20 and 30 feet, and are growing rapidly. The disposition of these trees to grow on the open sands is now being determined, and they may be seen everywhere peeping up above the lupine. The prospect for their successful growth is very good. Pines, acacias and eucalypti are fresh and green even in the most exposed positions. The experiments which the commission is making in this direction are exceedingly valuable to our farmers in the coast counties. If they succeed there will be nothing to prevent the barren wastes upon the shores being transformed into profitable forests, not only beautifying the shores and furnishing valuable fuel, but serving to break the sweep of the trade winds and thus tempering the breezes to the thousands of dairy cattle upon our seaside pastures. The questions of experimental growth cannot be attempted except in a small way by individual farmers because of the loss which failure entails, but the results in this park can be acted upon by all who possess similar lands. Thus the park may become an experimental forest, and give us the growths which actual trial shows fitted for the peculiar conditions which prevail.

We trust this commission may be enabled to prosecute this useful work. Their roadways are excellent for the speeding of city horses, their grassy slopes and rustic bowers and flower plots will delight gensrations of city people. This is all good; but a matter we deem of more importance to the State at large is that of reclaiming drifting sands and transforming them into the forests we need so much. In this direction we hope to see the work prosecuted to the end.—*Rural Press.*

Mining Prospects in Inyo County.

The Coso *Mining News* says: Never, since mining operations commenced, has the prospect for a brilliant future been so good for Darwin as at present. We said to our readers, some time ago, that the attention of capitalists was directed to the big bonanza, or that many of the moneyed men had gone to the Centennial, and we could not expect them to pay any attention to "outside properties." The Centennial is about over, so is the election; and as for the big bonanza, it accommodates a few of the kings of California street. Now, however, the princes step in and in their desire to become kings, they commence where they think and believe there is a show to win, and consequently they are investing their money in Darwin, Lookout and Lee district mines. The stages now arriving are loaded with passengers, most of them of the class we speak of—moneyed men, who have heard of our properties and have come to examine them. In no instance, that we are aware of, have experts sent by them made any other than a favorable report—except one or two who were instructed and paid for doing otherwise. It is true, none of our mines are, as yet, dividend-paying, but it is not the *fault of the mines*. This we have endeavored to show heretofore, and believe we have done so satisfactorily to all who know anything at all about the management of our mining affairs. It is to be hoped that in course of time this difficulty will be obviated, and that we shall soon be able to report at least one dividend-paying mine.

Let us review the situation and see what can be counted upon for the mineral portion of Inyo county. We now have in operation the three mills at Independence, two furnaces at Cerro Gordo in full blast, with strong probabilities that the Swansea works will be started up soon; then there are the two furnaces of the Modoc company at Lookout running successfully, while here in Darwin we have the New Coso furnace running, and an order has been sent below for another water-jacket. The works projected, and which will be in operation within the next six weeks, are a ten-stamp mill for the Minnietta Belle mine at Lookout, a thirty-ton furnace for the Hidalgo, here at Darwin, the two furnaces of the Defiance company, besides a good probability of the Cuervo company starting their furnace.

Thus it will be seen that we shall have in active operation, and all running at the same time, four mills and nine, perhaps ten, furnaces in Inyo county within a few weeks, and all sending bullion to the front. This must certainly have a telling effect in San Francisco, and ere the spring opens we may look for an influx of capital to as great an extent as that ever experienced by any other mineral section in its primeval state.

The only drawback to their successful and continuous operation that we can see is the fact that their supplies of coal now lie in the mountains, several miles away, and unless teams can be had to get the coal out before the snow falls to a great depth, they will all have to shut down in the dead of winter. There is plenty of coal already burnt, but teams are scarce. We hope this will be attended to in time, so that Darwin may not have another setback.

Mining Enterprise in Calaveras.

We are glad to know, says the Calaveras *Chronicle*, that there are mining enterprises in view, in the upper country, that when carried out will materially enhance the prosperity of that section of the county. We have it from good authority that Mr. W. V. Clark, proprietor of the Railroad canal, intends to extend his ditch to Mosquito Gulch the coming summer. The proposed extension will take the ditch 10 miles through a section of mining country that has hitherto been unsupplied with water facilities, and cannot fail of resulting in the opening and successful working of a large number of claims. An extensive area of mining ground, as yet comparatively unprospected, will be covered by the proposed lengthening of the canal, and with low rates for water we look for an energetic revival of gravel mining in the upper districts. The ditch has already been extended as far as Independence, and Mr. Clark is urging forward preparations for the opening of two mammoth hydraulics at that place. Everything will be in readiness for the commencement of piping in a few days. We also understand that it is Mr. Clark's intention to erect a five-stamp quartz mill at Mosquito the coming season, more for the purpose of affording facilities for prospecting the numerous ledges in the vicinity than anything else. These mooted enterprises are gratifying evidence that life has not entirely died out of the upper country yet, and that we may confidently look for lively times in that direction with the opening of spring.

West Side Irrigation.

Reports come that the surveying party on the ground of the west side of the San Joaquin valley is pursuing its work and the character of their report to the governor is foreshadowed. From an engineer who recently left the survey of the West Side irrigation canal, now being prosecuted under the direction of Wm. Hammond Hall, chief engineer, the Stockton *Independent* learns some facts relative to the project. The estimated length of the canal from Tulare lake to Antioch is 185 miles. It will be navigable throughout the whole distance, as it is to be constructed to carry five feet depth of water. The present plan on which the survey is being made, contemplates a canal 126 feet wide on the bottom, with slopes of three feet horizontal to one in depth, on the outside, and one and one-half on the upper or in-side. The grade to be used will be three inches to the mile, giving, for the body of water, a current sufficient to run a large quantity without damaging the banks. For the first 10 miles from Tulare lake across the Summit lake divide, the average cutting will be 10 or 11 feet to the mile, growing lighter as it gets further out on the plains. It is thought the survey will be completed and the line finally located about the 1st of January, after which some months will be required to make up the estimates, plans, maps, profiles and report, the 1st of May being the time fixed for reporting to the governor of the State the result of the surveys. The party had reached a point opposite Hill's Ferry a week or more ago. The party is a very complete one, consisting of 23 men, with a full camping and transportation outfit. The line runs parallel with the San Joaquin and Kings River irrigation company's canal for about 40 or 50 miles, being from one to two miles distant from it, and about 30 feet higher in elevation. The scheme, as planned, is an immense one, and its final completion, if it is ever built, says the *Independent*, will be hailed with joy by every land owner in the valley. The vastness of its beneficial results cannot be fully realized or comprehended.

TEMPERED GLASS.—A singular instance of the behavior of tempered glass, says the *Times*, comes to us from Mrs. Nassau Senior, who writes to say that on the 11th of last month she furnished 12 gas burners with tempered glass globes purchased in London, and having the veritable label of M. de la Bastie affixed to each. Two of these globes were fitted on burners in her bedroom, and on the night of the 6th inst., after the gas had been extinguished for exactly an hour, one of the globes burst with a report and fell in pieces on the floor, leaving the bottom ring still on the burner. Those pieces which were, of course, found to be perfectly cold, were some two or three inches long and an inch or so wide. Curiously enough, they continued for an hour or more splitting up and subdividing themselves into smaller and still smaller fragments, each split being accompanied by a slight report, until at length there was not a fragment larger than a hazel nut, and the greater part of the glass was in pieces of about the size of a pea, and of a crystalline form. In the morning it was found that the rim had fallen from the burner to the floor in atoms. It is interesting to note these facts, as they indicate that the tempering process affects glass in a most peculiar manner. It would appear desirable that an exhaustive physical investigation should be made in respect of this singular material.

AMADOR COUNTY MINES.—The Amador *Ledger* says: The mining interests of Amador county continue in a very prosperous condition. This prosperity is especially noticeable in the northwestern portion of the county, in the towns of Amador, Plymouth and Drytown. Everything indicates a yield of bullion during the coming winter considerably in excess of the production of several years past. We are just entering upon a new era of mineral development, which promises as solid and satisfactory results as any previous period in the county's history. The only want we feel is capital to develop our auriferous resources. The small capitalists within our boundaries have the utmost confidence in the richness of the mineral belt yet to be explored. Outside assistance, however, is required to prosecute the work on a scale which its importance demands. The capitalists of San Francisco would do well to turn their attention to Amador county as a profitable field for the investment of money. We are safe in saying that the returns would be proportionately greater than those which attend mining operations on the other side of the mountains.

THE San Jacinto tin mines, between Riverside and Temescal, are pronounced by experts to be as rich as any in the world, and are the only tin mines discovered in the United States. We were informed that arrangements were being made with a German company to work the mines. Many European tin mines assaying only 4 per cent. prove good investments, paying well all the time. The San Jacinto ore assays 18 per cent., and the owners expect, reasonably too, large returns on their money. Silver has also been discovered in the same neighborhood, but not in paying quantities; we also heard of coal croppings.—*Anaheim Gazette.*

USEFUL INFORMATION.

Preservation of Timber.

The *Building News* gives the following valuable information: Presuming the timber has been felled at the proper time and stacked with care, and is delivered in a good state ready for the builder, the means employed to preserve it are various, and must depend in a great measure upon the nature of the work for which it is to be employed. For instance, if it is for external work of a common character, the best preservative is to well paint it, and, while still wet, strew it with sand, and, as soon as the paint has perished, repaint it. For posts and piles exposed to the action of moisture in a great degree, the best means is to char the wood, as it then in a measure becomes incorruptible. Semple advises scorching the wood all over, and, while still hot, rubbing it with linseed oil and tar; the scorching can be effected by passing over the timber a powerful flame produced by coal gas and a blow pipe. As a preservative against worms nothing can be done better than to saturate the wood with any of the oils. As to the patent methods for the preservation of timber, there is one by Kyan, patented in 1832, which consists in impregnating the timber with corrosive sublimate, and another of a similar kind patented by Payne in 1841. The best preservative for timber I can recommend is (after having obtained the best seasoned, and when worked for the various purposes required), for it to be well rubbed with oil, and, when framing it in its place in the carcase of the building, taking care to keep it as much as possible from the masonry, and allowing the circulation of plenty of air without being liable to action of the weather, and when the carcase is complete, allowing it to stand as long as possible before the timbers are covered in, so that they may have, as it were, a second seasoning.

Wet and dry rots are two forms of decay which attack timbers exposed to the action of the weather, and the cause of both may be said to be heat with moisture. Confined air and evaporation cause dry rot, and imperfect evaporation wet rot. As a preventive against these rots the timber should be well seasoned, and if used where liable to be under the influence of sun and rain, should be well painted. If not painted they must be impregnated with linseed or oil of tar; but the best preventive is to allow a free circulation of air around the timbers, and the walls to be allowed to dry thoroughly before the introduction of the timbers. Should the timbers have taken either of these rots very little can be done to preserve them. If the rot is perceived to be at the end of beams only—and here it generally commences—the best way to preserve the rest of the timbers would be to cut away the decayed portion and scarf with sound. Should this not be practicable, the wood should be scraped and cleaned of all fungus or extraneous matter, and then impregnated with any of the oils, or some of the patent methods referred to above.

ETCHING IRON AND STEEL.—The fact has been demonstrated quite satisfactorily of late that much information is obtainable as to the chemical composition and physical character of iron and steel by etching it, and noting the changes which take place during the operation and the appearance of the surface after it is completed. In this connection the most valuable etching substance is found to be a mixture of equal parts of hydrochloric acid and water, to which is to be added a trace of chloride of antimony, one drop to the quart of acid. The latter substance, it is said, seems to render the iron less inclined to rust, so that after washing thoroughly in warm water and applying a coat of varnish, the etched surface may be preserved quite clean. The smooth surface to be etched is first surrounded with a ridge of wax an inch high, and the water poured into the disk thus formed at a heat of 55 deg. to 65 deg., Fah. The time required is until the texture is visible. When the etching is finished, the wax is removed, the iron washed first with water containing a little alkali, then oleen water, followed by brushing, drying and varnishing.

CENTENNIAL FIGURES.—The following are the official figures concerning the exposition:

Month.	Days.	Paid.	Total.	Receipts.
May.....	19	378,980	613,496	$189,490 36
June.....	26	695,666	932,177	347,833 40
July.....	26	635,518	906,447	318,192 26
Aug.....	27	908,084	1,175,314	415,659 26
Sept.....	26	2,130,991	2,439,689	928,056 00
Oct.....	26	2,334,530	2,663,879	1,160,811 50
Nov.....	9	918,956	1,038,391	453,700 00
Total..	159	8,004,326	9,789,392	$3,813,749 76

A recapitulation of the above shows the following:

Number of days open	159
Paid admissions	8,004,325
Free admissions	1,785,067
Total admissions	9,789,392
Grand total of receipts	$3,813,749.75
Average daily cash admissions	50,341
Average daily total admissions	61,568
Average daily receipts	$13,915.85

TO REMOVE PUTTY.—A block of iron about two and a half inches long by one and a half inches square, flat at the bottom and drawn out for a handle with a wooden end, like a soldering iron, is an excellent implement for removing old and hard putty from sashes. When hot (not red hot) the iron is placed against and passed slowly over the putty, which becomes softened by the heat and is rendered easily detachable from the wood.

Spontaneous Combustion of Oily Refuse.

Mr. J. J. Coleman, of Glasgow, has recently transmitted to the *Societe Industrielle* of Mulhouse, France, a memoir on the spontaneous combustion of oily refuse, and on the relative inflammability of the different oils employed for lubricating purposes. He describes a series of experiments upon fragments of cotton, linen, jute, and woolen waste, saturated with oils of different natures. The materials were placed in a box of tin, having a double bottom, in which steam entered, so that the part which received the refuse could be maintained at a temperature of 180 deg. Fah. A thermometer was inserted in the oily substance so that the variations of temperature occurring therein could be noted.

The results obtained show, first, says the *Scientific American* in a summary, that any vegetable or animal oil inevitably takes fire after a few hours, under the above conditions. On employing cotton waste the mass burns quickly and with flame, in contact with the air. Wool refuse is slowly transformed into a black carbonaceous mass. Second, the addition of mineral oil—known as lubricating mineral oil—serves to retard the spontaneous combustion of vegetable or animal oil if mixed in small quantity. If a large amount be added, inflammation is entirely prevented. The mineral oil used by Mr. Coleman is a very dense product (density 890), having great viscosity and emitting no inflammable vapors, even in contact with an ignited body at any point below 338 deg. Fah., or in other words, remaining safe at temperatures at which mixtures of less dense mineral oil or colza oil burn. The addition of 40 per cent. of mineral oil is sufficient to prevent spontaneous combustion. Twenty per cent. doubles the time necessary to determine conditions favorable to the same. Spontaneous combustion occurs most quickly when the cotton is soaked with its own weight of oil.

PORTLAND CEMENT ON WOODWORK.—Portland cement has many uses in the garden and elsewhere, not generally apparent. Some of them are enumerated by the *Garden* as follows: When made into a thin solution like whitewash, this cement gives woodwork all the appearance of having been painted and sanded. Piles of stone may be set together with common mortar, and then the whole washed over with this cement, making it look like one immense block of gray sandstone. For temporary use, a flour barrel may have the hoops nailed, so as not to fly apart, and the inside washed with a thin paste of Portland cement, and it will serve for a year or more to hold water. Boards nailed together and washed with it make good hot water tanks; and it is of use in so many ways that it may be regarded as one of those peculiar things in a garden which it is always good to have at hand.

GOOD HEALTH.

Diphtheria.

This fatal disease is now making sad inroads among the children in many parts of our State. All information concerning the disease is of the greatest importance. We find a long essay on the subject in the *Physician and Pharmaceutist*, by Dr. R. Tauszy, from which we quote as follows:

We have herewith, I hope, conclusively proved the correctness of the following propositions:

1st. That diphtheria is dependent upon minute vegetable organisms, which invede the system through an abraded skin or an abraded and inflamed mucous membrane.

2d. That bacteria are easily distinguishable, microscopically, from detritue, fat or albumen, by the glycerine, acetic acid and heating test.

3d. The contagion of diphtheria is not a gaseous substance.

4th It is most assuredly first a local disease, and, after existing a certain time, becomes general.

5th. Catarrh, nasal and pharyngeal, one or both, always precedes it, or may be regarded as its first stage.

6th. That croup and diphtheria are not identical diseases; croup exudations never enter the circulation; croup always remains a local disease, and kills only by mechanical obstruction, of the larynx for instance.

A few words as to treatment. Dr. Jacobi's suggestions in this respect are so good that I will copy most of his remarks bearing upon this point as deserving to be adopted generally. Dr. Jacobi says: "With the local attendance the large majority of cases will recover; without it, they will die." How can we imagine an emuiform poison to lodge on a tonsil, or the soft palate? Is this not more apt to enter the lungs, and through it the circulation? Dr. J. further says: "There is no infectious disease that can be more readily and more satisfactorily managed than diphtheria. A case of diphtheria, mild or severe, ought to be attended at once, without loss of time. Many a case of diphtheria I have not attended, because I believe I have prevented it."

Dr. Jacobi suggests: "Isolation, nasal and pharyngeal catarrh must be cured; hypertrophied tonsils must be resected at a time when no diphtheria prevails. Avoid all bloody operation. Chlorate of potash one-half ounce to a drachm, internally taken during 24 hours. Disinfection is our main reliance, our sheet-anchor." The Doctor's warning is very appropriate, where he says: "In children, especially, the tendency to month catarrh, caries of teeth, pharyngeal and nasal catarrh, congenital and acquired enlargement of tonsils, exposure to cold air, inhalations of dust, cauterization, are just as many invitations to the diphtheritic poison." Dr. Jacobi speaks highly of perchloride of iron as an astringent and disinfectant. He gives in diphtheria 15 drops every half or every hour. In croup, which very wisely is considered a separate disease by Dr. J., not at all identical with diphtheria, he recommends ice externally, emetics as required, lime inhalation for the purpose of dissolving the membranes. In fever, washing, bathing, ether, wine, brandy, camphor, musk, ammonia. In nasal diphtheria inject the nostrils with two to four grains of carbolic acid to the ounce of water every hour.

Salicylic acid is now used in preference; from two to four grains every hour, or every two hours, according to the severity of the symptoms, should he given to a child between five and ten years old; smaller and larger children according to their respective ages. It is best to give salicylic acid in powder. It thus comes in closer contact with the bacteria, which it kills, than when given in a liquid form. The permanganate of potash, grain x to the ounce of water, of which a teaspoonful is mixed with a usual tumbler of water, may be used as a mouth-wash even during health as a prophylactic.

Signs of Health and Debility.

Dr. Reginald Southey, in one of his lectures on "Individual Hygiene," sums up the signs of sound health and debility as follows: A sound constitution depends upon a body well constructed both inside and out, and upon a balance of functions, circulation, respiration, innervation, digestion, sanguification, each well, all unconsciously fulfilled; upon a temperature well maintained all the body over; and last, but by no means least, upon good habits of life. A man, as Celsus said, is not to live too much by rule; he should be the master, not the slave of his body.

The state of health is a state of very perfect hæmatosis, in which the tissues of the body are neither too moist nor too dry. Flabby muscles and hydræmis of the intercellular tissue are suggestive of debility if not of actual disease. There appears to be a maximum of solidity, a ratio between weight and night and girth, which coincides with that period of life when the energy or vigor is greatest, when each individual is capable of his greatest feats of strength and endurance; it is better marked in males than in females, and happens at or about the 30th year of life. This is the quality of body which the hygienist aims at prolonging.

The following signs may be accepted as evidence of sound health: 1. Individual adaptability: the capacity in man to adapt himself to extremely opposite conditions of existence without suffering insnergy. 2. Endurance: the capacity of supporting considerable bodily or mental labor without suffering from fatigue, or of repairing the latter quickly. 3. Self-command: the capacity of controlling the emotions, blunting as well as sharpening the sensations of will. 4. Resistance to morbific influences: the capacity of eliminating all poisons quickly by dint of sound organs of excretion.

The following signs of debility ought to be enumerated as well: 1. Deformity, obesity, leanness: bad construction of the skeleton or of its clothing. 2. Personal inadaptability: liability to disturbance of either mind or body upon slight provocation, such as change of food, clothing, climate, or any interruption of the ordinary habits. 3. Lack of endurance: small staying powers, requiring long rest to repair fatigue. 4. Small emotional control: the persons who are quickly provoked to anger, or are speedily moved to tears or laughter, exhibit feeble nervous system, and are prone to nervous disorders. 5. Proclivity to morbific influences: those whose organs of sanguification or of elimination are damaged; who, although equal to ordinary calls upon them, exhibit their inefficiency by succumbing to every contagion, miasma, or poisonous influence that they encounter.

SEA WEED FOR OBESITY.—A writer in the Paris *Medical* recommends the administration of sea water in the treatment of obesity, the dose prescribed being a small glassful three times a day, in a little fresh water or milk. Considerable attention has also been recently given to the gulf weed, *Sargassum bacciferum*, which has been recommended by physicians for the same purpose. The fluid extract manufacturers, always on the lookout for "novelties," have recently introduced a fluid extract of sea weed, under the name of *Fucus vesiculosus*. It is asserted, however, by some physicians who have used this extract, that it is worthless, and that an infusion, or "tea," made from the weed, should be used. The peculiar virtues ascribed to sea weed are doubtless due to the presence of iodine, though it would seem that the quantity present would be too small to produce any marked effect.

ANTIDOTE FOR MUSHROOM POISONING.—Prof. Schiff has recently demonstrated that muscarina, the poisoning principle of mushrooms, may be promptly and efficaciously counteracted by the administration of atropine or daturine, but particularly by the latter.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, W. B. EWER, GEO. H. STRONG JNO. L. BOONE

Office, No. 224 Sansome St., S. E. Corner of California St., San Francisco.

Four weeks ars rated a month.

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper inserted at special rates.

SUBSCRIPTIONS payable in advance—For ons ysar, $4; six months, $2.25; three months, $1.25. Remittances by Registered letters or P. O. orders at our risk

SAMPLE COPIES.—Occasionally ws send copies of this paper to parsons who ws believs would be bensfited by subscribing for it, or willing to assist us in extending its circulation. We call ths attention of such to our prospsctus and terms of subscription.

THE ORIGINAL ARTICLES in this paper ars mostly set in solid type, giving in our columns one-third more reading than is contained in ordinary leaded matter.

ADDRESS all letters to the firm, and not to individual members, or others, who may at any time be absent from our office.

Our latest forms go to press on Thursday evening.

San Francisco:
Saturday Morning, Dec. 2. 1876.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Comstock Papers; Patent Hoss Attachment; Struck It, 361. The Government and the Mines; Cooling Air in Mines; Items of Interest from the Mines; California Petroleum, 366. Industrial Education; Broad Winged Buzzard; Mechanical Ore Concentration and Separation, 369. Proceeds of Comstock Mines; Patents and Inventions; Notices of Recent Patents, 372-3.

ILLUSTRATIONS.—Tremhley's Patent Hoss Attachment; "Struck It," 361. Broad Winged Buzzard, 369.

CORRESPONDENCE.—Mors of the Quartz Mines of Madison County, Montana, 362.

MECHANICAL PROGRESS.—The Influences of Piece Work; A Powerful Digging Machine; Making Mosaics; A Painting Machine; Winans' Novel Organ; The Paris Exhibition of 1878; Fast Steaming; Chance for Inventors, 363.

SCIENTIFIC PROGRESS.—What is Phosphorescence; The Last Arctic Expedition; Photographing the Sun; The Twinkling of the Stars; Wool and Hair Under the Microscope; Science of a Cigar, 363.

MINING STOCK MARKET.—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments; Meetings and Dividends; Review of the Stock Market for the Week, 364.

MINING SUMMARY from various counties in California, Nevada, Arizona, Montana, Idaho and Utah, 365-72.

THE ENGINEER.—The North Sea Canal; Suez Canal; The Eads Jetties system; Railway up Mount Washington; New Map; St. Anthony Falls; Kennebec River, 366.

USEFUL INFORMATION.—Preservation of Timber; Etching Iron and Steel; Centennial Figures; To Remove Putty; Spontaneous Combustion of Oily Refuse; Portland Cement on Woodwork, 367.

GOOD HEALTH.—Diphtheria; Signs of Health and Debility; Sea Weed for Obesity; Antidote for Mushroom Poisoning, 367.

GENERAL NEWS.—General News Items and Miscellaneous Paragraphs, on 373 and other pages.

MISCELLANEOUS ARTICLES.—The Wealth of Washoe; The Morgan Mining Suit; Another Mineral Discovery; Opening ths Mine; The Tuolumne Hydraulic Company; The Boss Cable, 362. Golden Gate Park; Mining Prospects in Inyo County; Mining Enterprise in Calaveras, 366. Cement Wine Casks; Unpatented Mines; Preparation of Platinum Black with Glycerine; Shipments of British Coal to San Francisco; Statue to Oersted, 370.

NEW ADVERTISEMENTS.

Improved Portable Hoisting Engines. Hawkins & Cantrell, S. F.; Machine and Model Works, I. A. Heald, S. F.; Eagle Quicksilver Mining Co.—Sals.

THE AMERICAN JOURNAL OF MICROSCOPY.—The experiment of a msgazine wholly devoted to microscopio atudy and literature has proved a success. The publication which we have named above has completed its first volume. It haa begun in a small way to be sure, charging but 50 cents a year, but even a child of this size has taught the oldest scientific msgazine in this country a lesson, aud exploded what seems to have been a deliberate fraud perpetrated through its columns in name and form of science. We refer to the so-olaimed discovery of ooe "Prof Wilsou" that silica in the shape of diatoma entered from the soil to the straw of grain, and ou the strength of this claim endeavored to swindle the farmers of the country by selling them diatomaceous fertilizers. This awindle was expoaed by the *American Journal of Microscopy* aud it has earoed the honor which its vigorous youth now bears in scientific circles.

JAMES E. GORDON, importer and dealer in hardwnre, and manufaoturer's agent, has moved from 359 Market street, oppoaite to 254 and 256 Market. The new premises also front on Nos. 8 and 10 Front street. Mr. Gordon haa moved three times auce his establishmeut in business, but the old adage of "the rolling stone gathers no moss" is not spplicable in tbia case, as he has moved each time in order to get more room to keep pace with an increase in bnsiuess.

The Government and the Mines.

Within the comparatively brief space of a quarter of a century our people have opened up to settlement a larger area of territory, valuable as a source of supply for nearly all the necessities of man, than has ever before in the world's history been brought withiu the limits of civilization in so short a time. Twenty-seven years ago California, Arizona, Colorado, Montana, Idaho, Washington Territory, Oregon, Utah and Nevada—occupying more than one-third of the entire area of the United States—were regions chiefly known to trappers and traders; traversed and occupied for the most part by tribes of barbarous Indians. That this extraordinary advance, with all its accompanying reaalts to the trade and the commerce of the world haa been achieved by the discovery and developmeut of our mineral resources, no reasonable man pretends to dispute. The steady progress of our history speaks for itself and the facts are patent to all.

It seems somewhat singular, considering the millions of treasure thus added yearly to our national wealth, the vast range of industry opened to our people, the wonderful impulse given to agriculture, commerce and manufactures, that of all our great national industries the business of mining has had the hardest struggle to enlist the favorable consideration of our government. Not only has the government paid little official attention to it, but outside of the borders of the States where mining is carried on, very little is known concerning this industry by the people.

The immense production of what are known as the bonanza mines baa probably attracted more attention to the subject than anything arising for years. The government is also soon likely to have very important questions concerning the mining industry brought before it for official action in the coming suits between the agriculturists and hydraulic miners with regard to tailings. But it is only when some unusual circumstance brings the subject prominently forward that anything connected with it is noticed by the government. A mining commissioner, with a very limited appropriation to work with, has been authorized by Congress to collect statistics for several years past, but this office is to be, or has been, abolished, and the collection of statistics left to the direc or of the mint. With the duties he now has, this official will he unable to do much in a new direction, so that there will hardly be any more official reports on the mining industry of the United States west of the Rocky mountains.

The reports previously published have not been up to the proper standard, simply for want of funds. A large amount of the matter contained in them was furnished gratuitously, and the commissioner has been unable to get out a report which would be a credit to himself and the nation. Moreover, such a very limited edition of the report was published that only a few of them found their way to this coast, when they should have been in the hands of every miner as the agricultural reports are in the hands of the farmers.

The mining industry, however, though by no means fostered by the government, has continued to flourish and proved its title to recognition by facts in the shape of good hard dollars. It will still continue to do so, even though the government pays so little attention to it that it does not consider it worth while to keep a single official whose duty it is to collate information and statistics on the subject. The fact is to be deplored, however, that no pains have been taken to establish a national mining college; to gather practical information of use to miners; to exchange experience with older countries officially; or, in short, to take any interest whatever in the mining industry in an official manner.

Cooling Air in Mines.

In many mines the normal temperature of the air is often so great that it is impossible for workmen to remain any great length of time in them unless some means for refrigeration and ventilation are used. In some of the mines of precious metal, for instance, the temperature is reduced by the use of ice that is carried down into the shafts and levels and placed in close proximity to heated places, where a mixture of water and ammonia is poured over it to assist the process of cooling; but this method only produces a partial effect and is attended besides with much discomfort and inconvenience to the workmen, for the vapors arising from the melting ice produce an atmosphere more or less humid, and the presence of the ammonia act free in the evaporation adds to this disagreeable condition of the air.

To overcome these difficulties Mr. Robert H. Lucas, of this city, has patented through the MINING AND SCIENTIFIC PRESS Agency an apparatus and method of dehydrating and refrigerating air. The invention not only relates to the art of preserving substances by surrounding them with cold air, but also to the production of an atmosphere or a column of air of an exceedingly low temperature, which may be caused to displace the heated air in mines, to reduce the temperature so that mines can be worked in a more rapid manner and with greater comfort and safety.

Two conditions are necessary in order to properly preserve animal and vegetable substance by the refrigersting process: first, the air must be cold, and second, it must be dry or free from moisture. The improvement in question provides for accomplishing both of these conditions simultaneously in a simple and effective manner. It consists in surrounding the pipes through which a refrigerant gas is conducted with any deliquescent salt, in combination with an air-forcing mechanism which will cause the air which is to be dehydrated and cooled, to come in contact with the salt.

The inventor finds that by forcing the air to be cooled, over and in contact with pipes which are surrounded by a deliquescent salt, such as chloride of sodium, chloride of calcium, caustic potash, magnesium or other equivalent deliquescent substance, and through which a refrigerant gas is caused to flow, he can not only cool the air to an exceedingly low temperature, but also extract the moisture from it, so that it will be better adapted to breathing purposes. The action of the refrigerant gas within the pipes is to reduce the temperature of the air which is blown over them, while the deliquescent salt extracts the moisture from the air, leaving it dry and cold. As the deliquescent salt removes the moisture it gradually dissolves and must therefore be replaced. In order to retain the salt in proper proportion around the pipes a netting or wire gauze tube is constructed of larger diameter than the pipe, and this tube is supported by suitable means around the pipe. The space is then filled in between the pipes and the surrounding perforated gauze, with the deliquescent salt. Chloride of sodium—common salt—is the most convenient for this purpose.

It will be evident, then, that if air be forced against and in contact with the pipes the cooling agency of the contaiuing circulating refrigerant gas will reduce its temperature, while the salt will extract the moisture, thus producing an atmospheric condition which is highly valued, not only as a breathing medium, but which is indispensable in properly preserving animal and vegetable substances in a fresh condition. Various methods of arranging the pipes for conducting the gas and any volatile substance such as is used in ice machines for producing a refrigerant effect can be used in connection with the improved method. These can easily be supplied and arranged by any person familiar with such machinea in general.

Items of Interest from the Mines.

We give below items of interest from prominent mines, most of which are collated from letters of the respective superintendents on file at the offices in this city. Considerable of this news is later than that procured from the interior journals:

Advices from the Manhattan mine state that the average of the orea worked during the past week is $193.57 per ton. At the Front shaft the stopea above the 500-foot level are now turning out a better quality of ore than usual, and continue to yield the desired quantity. The 500-foot east drift continues in fine ore. This drift is now in a distance of 100 feet and baa been run in rich ore the entire distance, which shows that the chimney is increasing in width (that is, lengthwise on the vein) as we go down.

The Eureka (Grass Valley) letter of the 25th says: Our clean-up for the last six days' run, of 10 stamps, 12 hours per day, is 270 ounces of amalgam. In cross-cut from No. 3 shaft we have had a very hard bar of ground to go through, but the drill has worked very well and made 16 feet in five days.

The Belcher is shipping 200 tons of ore per day to the mills. The water in the incline has been so far overcome as to let them go on sinking.

Chollar letter of the 25th says: Operations at the Company's mine for the week ending to date give the following results: Number of tons of ore extracted, 748; number of tons forwarded to milla, 832; average assay value of ore mined, $30.50 per ton. Main incline has been sunk 22½ feet. Pump worked 17⅞ hours. Shipped to-day three bars of bullion, value, $7,811.91.

The California is turning out 40 tons of ore per day from the 1400-foot level. The ore breasts on the 1500, 1550 and 1600-foot levels are looking very well and yielding the desired quantity of rich ore.

Water continues very strong in both the Consolidated Virginia and California mines. Savage has lots of it too.

Last letter from the superintendent of Raymond & Ely says: There is no material change with character of development in the mine since my last report. The west drift on the 11th level has been extended 26 feet during the week, making its total length 185 feet. The raise from west drift eighth level, did not show anything of value and I have discontinued the work.

In the Crown Point mine they found it absolutely necessary to retimber a large portion of shaft and incline in order to keep them in proper condition for working the mine; with that view they are now putting in about two sets per day. The expense will be less by doing it now than if allowed to run longer without making these repairs. No ore being extracted.

In the Comanche it is reported that there is a vein of ore in the stopes about a foot wide which will average about $100 per ton. The stopes above the 550-foot level are running more into sulphuret ore every day and gradually improving.

California Petroleum.

At the meeting of the California Academy of Sciences last Monday, Mr. C. D. Gibbes, described the oil region in Tulare valley, west of Tulare lake. Mr. Gibbes discovered these springs as long ago as 1854, while surveying for the government; and in 1865, with another party, purchased 200 acres on which are 12 or 15 oil springs, extending in a line for a distance of about half a mile. They are named the Naphtha oil springs, and are located in the valley at the eastern base of a hill or spur of the main range of mountains.

Mr. Gibbes describes the geological formation in which the petroleum or crude oil occurs in this portion of the State as shalea and sandstonea on each side of calcareous fossiliferous rock, filled with shells of a species of *Turritella*. These shells by attrition formed the mud which in process of time became limestone and is now so hard that it requires repeated blows of a hammer to break it. This ledge of limestone rock is at least 50 or 60 feet thick, or rather consists of a series of layers of different thickness from three to six feet each, constituting one immense wall or ledge, with a slight dip to the east. In some places it crops out widely and can be traced for miles, forming the crest of the ridges or spurs from the main range of mountains; these spurs have a trend to the southeast. Mr. Gibbes calls this ledge the oil producing stratum, for although no oil can be found in it, yet it is a good indication, as the oil is found making its appearance on the surface on both sides of it, although not always close to the main ledge, nor continuously, but occasionally where it can find a vent.

On the trip made in September last, when these examinations were made, Mr. Gibbes also located two other oil springs, one on the east or upper side of the ledge, and the other on the west, or under side, for he thinks this stratum of fossiliferous rock underlies the Tulare basin and will be found cropping out on the east side at the foothills of the Sierra Nevada. The spring he located on the west side (samples of the product of which were exhibited) is at least 500 feet from the main ledge, yet the limestone rock containing fossils is found here also, but does not crop as bold as what is called the main ledge, which is as well defined as a stone wall fifteen or twenty feet above the surface. Whether this shell rock is 500 or 600 feet in thickness will have to be determined by a more careful examination.

To the east of the main ledge, at a distance of about 600 feet, is a stratum of infusorial earth from 80 to 100 feet thick, the space between them being principally occupied by sandstone. Still further east two other species of shells are found in different ledges twenty or thirty inches thick, cemented together by sand and sometimes mixed with petroleum; one is of the sub-order *clypeastroidea* (cake urchins) and the other the *arca*. The gypsum belt lies still further east and in it are found fossil bones and teeth of sharks; also marine shells of different kinds.

These springs are situated 12 or 15 miles west of Tulare lake, on which a small steamer makes three trips a week from the western shore to Kings river, or a landing near Mussel Slough. The best mode of transit for the oil would be to carry it through pipes to a reservoir at the lake, where it can be shipped in barrels on a barge towed by the steamer up Kings river to where the railroad will cross it.

The crude oil can be extracted from the petroleum at the wells; the coke is expected to produce fuel enough to run the furnace, and the burning and lubricating oils can be refined at some establisbment here or elsewhere. It will be seen from Mr. Hanks' analysis (which we append) that this crude oil contains a large percentage of the heavy or lubricating oils of the finest quality, which is more valuable than the burning oil and not to be obtained from the Pennsylvania wells.

Mr. Hanks' report is as follows: "I have made an analysis of a sample of this crude petroleum and the following is the result: One hundred parts, by measure, was placed in an iron still and all the volatile part driven over by the application of heat. The result was the residue or coke left in the still and the crude oil. This, when separated from the water, was found to be 45 per cent. by measure. This sample of oil has a specific gravity of 921, equal to 22° Beaume's hydrometer.

"The crude oil was returned to the still and submitted to a careful fractional distillation, of which the following is the result:

	Sp. gr.	Deg. B
1st, 25 per cent.....Sample 8.....	.8374.....	37 deg.
2d, " " ..... " 4.....	.9142.....	23 deg.
3d, " " ..... " 5.....	.9464.....	18 deg.
4th, " " ..... " 6.....	.9505.....	17 deg.

One hundred parts by weight of the original sample would yield:

Coke, sample 1.....	17.61
Crude oil, sample 2.....	83.39
Total.....	100 00

"Sample 3 is a light oil and might be suitable for burning. By treatment with sulphuric acid and potash and redistillation a much lighter product would result. Samples 4, 5 and 6 are heavy oils, suitable for lubrication. It might be advisable to mix them to produce an equal grade for machine oil. There can be no doubt of the value of this product as an article of commerce. If found in sufficient quantity, it must prove a source of wealth to the owners and a great addition to the mineral wealth of the State."

Industrial Education.

"Industrial Surveys and Experiment Stations."

On Friday of last week Professor Hilgard delivered a lecture at the University of California on "Industrial Surveys and Experiment Stations," the following being a synopsis of the speaker's remarks:

The speaker opened his lecture by alluding to the several eloquent appeals that had been delivered at the University in behalf of industrial education. He said: I do not propose to repeat what has been so well said and so truly. My object is rather to address to you a few supplementary remarks, regarding some of the practical applications of that education, and industrial science.

A Course for Students.

The course which I hope some of you will choose to go through here, when completed, will have taught you the why and the wherefore of agricultural and technical operations. You will all, I hope, come out ahead of that undesirable "muddle-headedness," which makes a little knowledge so dangerous. Common sense is as indispensable in scientific pursuits as in the most ordinary affairs of life.

Object of Technical Courses.

Scientific reasoning is but the logic of common sense, strictly and systematically carried out in the most comprehensive manner. In the technical course here, our primary object is, after a modicum of general education, which is an indispensable prerequisite to teach youth principles upon which you should work, exemplifying the application to practice as much as possible by examples taken from actual life and practice. It is teaching you the principles, and not handicraft alone, that we prepare you for the exercise of your chosen profession. Not in one spot or limited circle only, but anywhere in the world. The great majority of your fellow citizens are of necessity so situated as to be obliged either to learn from costly experience or resort to professional advice in any case of difficulty. It has long been acknowledged that parallel with the duty of the State to provide educational opportunities, not supplied by private enterprise, runs the other duty of enabling the whole population to avail themselves of the advantages offered by the progress of modern science, at least to the extent of an examination by competent hands of the native resources of each State. Such examinations have been carried on under the national and State governments from the early part of this century.

Geographical Surveys.

Since geology was not only the first in order of time to follow geography, but is of some fundamental importance in determining the features of a country, those explorations have generally received the name of geographical surveys. New York took the lead in enlarging the scope of inquiry in instituting her "Natural History Survey;" and the act organizing this work is a page in her history of which New York may well be proud.

Many mistakes have doubtless been made by those to whom the management of State surveys has been entrusted. It could hardly be otherwise when we consider that there are probably no two States in which, were the work conducted to the best possible advantage, the order and manner of proceeding should be precisely alike. I know from my personal experience it is impossible to satisfy all critics.

Prof. Whitney's Surveys.

I do not stand here as a special advocate of Prof. Whitney's order of procedure; but I do wish to say here, as an expert, that whatever he has ordered to be done was work that needed doing, and it has been well done as far as it goes. The scientific groundwork has been laid, and well laid. It now remains to work out its practical side; and right here, unfortunately, the survey has been stopped. Where is the settler or immigrant to go for authentic information regarding the lands of this State? Now, it is precisely this kind of information that is wanted by every farmer, immigrant or investor—an authentic, systematic, intelligent and scientifically accurate account of the important features of a State and its natural subdivisions. It is just this class of facts that a State survey should primarily furnish. While it would be a waste of material to omit the publication of the record of purely scientific observation, which must be the groundwork, there must be a portion of the report written especially for the industrial classes, in the plainest language possible, giving the facts and conclusions that interest them directly. This portion of the survey report should, in other words, be the text-book from which every one interested in industrial pursuits could at once call the facts that are of interest to him.

Experiment Stations.

There is another feature which is at once suggested by the many practical questions arising in the discussion of observations made, and of experience collected in the course of an industrial survey. This is the desirability of a number of so-called experiment stations, located at suitable points in the different agricultural or industrial subdivisions of the State, for the purpose of testing on a scale sufficiently large those practical observations which can only be decided *in loco*, while the physical and chemical examination of soils, for example, can convey highly important suggestions in regard to the best and cheapest method of maintaining or restoring productiveness; yet the indications will, as a rule, require the test of experiment before they can be confidently recommended for general acceptance. The agricultural grounds and laboratories of the University already constitute one of these experiment stations, but common sense teaches that such stations should be numerous, on account of impossibility of producing in any one locality all the various circumstances that would influence the results of experiments made in the regions specially concerned.

European Experiment Stations.

Already in Europe, and especially in Prussia, these experiment stations are scattered broad cast over the land. To them are referred for decision by the most practical and reliable hands all the practical problems which no individual farmer could be expected to settle in such a manner as to render the results generally useful. Experimenting is rarely remunerative at best. Few private individuals can afford to undertake to carry out consistently a series of experiments such as are ordinarily required to settle agricultural questions. And now finally some of you may ask, *cui bono?* Why should all this trouble be taken, and this expense gone into?—are we not doing splendidly? Well, yes, California is doing splendidly; and with her delicious climate, fertile soil, there is every reason that California should do well. There are some who seem to imagine that our State is a world to itself; that the natural and social laws in force elsewhere do not necessarily hold good in California. One of these most important and varying lessons is that improvident and exhaustive culture, such as is now too prevalent in this State, will surely, and with our improved implements perhaps more rapidly, bring about the insolvency of any agricultural commonwealth. The South suffered terribly for not making this provision.

What Our Legislature Ought to Do.

Shall California follow the example of improvidence set by her older sisters, until the same ills which now weigh on them shall become generally felt? Her soils are rich but not inexhaustible. Let us not consider it too early to take measures for the prevention of such a disconsolate condition of things. Foremost among the means of prevention is the diffusion of the knowledge of the principles of rational agriculture, and of their application under the varied circumstances of soil and climate existing in this State. From the position you will, I hope, occupy among the rising generation, on account of the superior educational advantages you have enjoyed, many grave responsibilities will rest upon you, students of the University. Among these responsibilities, few will be graver than that of the influence which you may exert in behalf of progressive agriculture and industrial education, whether as legislators or educated leaders of public opinion.

Broad Winged Buzzard.

The usual range of the broad winged hawk (depicted on this page) seldom extends far west of the Alleghany mountains; but in Virginia, Maryland and the States eastward it is by no means a rare species. Its nest is about the size of that of the common crow and is usually placed on large branches, and near the stem or trunk of the tree, being composed, externally, of dry sticks and briers, and internally, of numerous small roots, and is lined with the large feathers of the common fowl and other birds.

The flight of this hawk is easy and performed in circles, when high in the air, it often closes its wings for a moment, and glides gracefully along. It seldom pursues other birds of prey, but is itself frequently teased by the little sparrow hawk, the king bird, or the martin. It attacks birds of weak nature, particularly very young chickens and ducklings, and during winter feeds on insects and various small animals. Except during the winter season, it flies singly. After eating, it rests for hours upon the top of a small tree within the forest. Like other birds of its tribe, when wounded, it throws itself on its back, opens its bill, protrudes its tongue, utters a hissing sound, erects the top feathers of its head, and with its talons grasps any object presented to it, insomuch that it may be carried by means of a stick thus clutched as long as its muscular power continues. When feeding, it holds its prey with both feet, and tears and swallows the parts without much plucking. In its stomach have been found wood frogs, portions of small snakes, and the hair of small quadrupeds of several species.

THE BROAD-WINGED BUZZARD.

ACCIDENT AT SILVER MOUNTAIN.—A miner named Thomas P. Floyd was saved on and almost instantly killed in the Exchequer mine, at Silver mountain, Cal., on the morning of the 22d instant. Mr. Floyd was at work with his partner, Arthur Peirce, on the 400 foot level. The rock was hard, and while trying to split it, with a gad, a large body of rock, weighing from ten to twelve tons, suddenly gave away, crushing Floyd beneath it. Peirce fortunately escaped almost uninjured.—*Gold Hill News.*

Mechanical Ore Concentration and Separation.—No. 12.

[Written for the PRESS by FRANCIS M. F. CAZIN, M. E., Santa Fe, New Mexico.]

Where mechanical concentration has been discredited by failure notwithstanding the apparatus employed were such as were accredited in the trade, and the management a skilled one, it has invariably been in the treatment of silver ores proper. The cause thereof is evident, in a fact not generally known or not properly appreciated. This is:

Silver Ores Proper

Or silver in all mineralizing combinations is more apt to change its mineralogical character, that is, to lose its proper cleavage and specific gravity by atmospheric influences or by corrosion than all other metals in their combination with metalloids. Thus surface ore may contain galena in a sound mineralogical state, but all accompanying silver ores proper will be found in that corroded state which the miners of the Rocky mountains invariably call "sulphurate," although most commonly they are what they are by the replacement of sulphur by oxygen. In greater depths also reached this corrosion is found common with silver ores proper, where galena, copper and iron pyrites are found sound and natural.

In the corroded earthy state these silver ores lack all the qualities on which mechanical separation can be based, and therefore

Cannot be Dressed Mechanically,

Not even with the best appliances out for the treatment of slimes. But invariably they will go with the slimes, and thus be collected in a shape where by roasting and amalgamation the silver can be cheaply recovered. Therefore in all similar cases mineral dressing is not by necessity discarded but confined only to what it legitimately can be applied, supplemented by any other system necessary to accomplish the work.

Mineral dressing is

Not a New Trade.

As early as 1812 Schroll wrote a treatise, "Contribution to the Art and Science of Mineral Dressing." Since then, at short intervals, Stifft, Karsten, Villefosse, Russegger, Rittinger, Gaetschmann and Kuestel have written books on the subject; and what weighs better with the practical men of the West, since then wealth has been produced by the millions every year in Europe by mineral dressing, where in no other possible way a cent could have been made.

In stating the fact that sand-rock carrying one per cent. of galena and the clean galena with 14 ounces of silver only has been worked by the help of mechanical mineral dressing and the company so doing to be to-day one of the richest and most influential in mining matters on the European continent, I run the risk of being looked upon as exaggerating for the benefit of the method I recommend, but the facts are true and of public notoriety.

It has particularly been proven by three years' operation, that in the Middle States of this continent, two and one-half per cent. of galena, worth four cents a pound, and no silver, will cover the costs of mining and mechanical dressing, the higher percentage coming in for a margin. What may be done on the Pacific coast may thereby be calculated. Unfavorable circumstances may considerably augment cost and even prevent profitable work with tenfold the yield, but there are certainly many mining localities on the coast where circumstances may be found as favorable as anywhere in the Middle States, or nearly so.

Thus far, speaking of practical results, I can, all in all, only refer to

Wet Concentration,

To the action of wet jigs and slime tables. In this is my excuse for not treating further on the dry process. Whatever allowance may be made in theory for the dry process of mineral dressing, no practical results can, as yet, be shown up by it. I do not thereby wish to contest against some figures published, concerning single tests of dry mineral dressing, but speak of results influencing business and national wealth, as can be cited by the hundreds in favor of wet concentration, which has been and is a part of national industry and economy in European mining districts, and of late in the Eastern and Middle States of this union, and of equal importance as smelting. Dry concentration is, with all that, nothing new. It has been largely experimented upon and practically tried in Belgium long years ago, but has been dropped and has been lost sight of in real practice, until revived lately by Krom and others, for whose success I wish well, but which, as yet, is not available in practice and business.

BULLION SHIPMENTS.—Since our last issue shipments from prominent mines have been as follows: Arizona, Nov. 19th, $2,467; Con. Va., 21st, $106,375; Leopard, 23d, $5,101; Ophir, 24th, $25,912 82—total to date, $50,022.66; Northern Belle, 23d, $12,001.90; California, 24th, $65,653 72—total to date, $715,883.20; Con. Virginia, 24th, $97,914 45—total to date, $443,090.90; Manhattan, 24th, $12,209.46—total for the week, $23,569 57; Modoc, 24th, 232 bars—total to date, $77,384; Challar, 24th, $9,707.68; 25th, $7,511.91—total to date, $42,619.88.

Cement Wine Casks.

The following investigation, which we find in an exchange, will interest some of our readers, who, if we mistake not, have made similar experiments: M. Bollert, near Zurich, in 1871, attempted to substitute casks made of cement for the usual wooden ones for storing wine, his cellar being moist and destructive to wood. The success of the experiment was such that all the wooden vessels have since been thus replaced. Among the advantages ascribed to the cement casks in additon to diminished cost of construction, are great economy of room, great solidity, without expense for repairs, diminished loss of the contents, and lightening of the work in the cellar. New wine is filled into them without hesitation, as no injurious effect is noticeable. The general plan of construction was first to coat suitably selected portions of the cellar walls roughly with cement mortar, and then with the best pure Portland cement, and to form the other portions of the vessels by pouring the material into suitshly constructed wooden molds. He succeeded in rendering the finished vessels deceptively similar in external appearance to the wooden ones. After the interior was sufficiently hardened, they were filled with water for ten days to ascertain whether they were tight, and also to extract the caustic ingredients of the cement. The latter object was not, however, fully accomplished in this way, as the wine lost almost all its acidity in a few days, but soaking with a solution of carbonate of ammonia and subsequent rinsing with water proved much better, and the objection on this account was ultimately removed. Others have also employed them since then, and their introduction to the wine growers on the Mosel is also contemplated.

UNPATENTED MINES.—The following from the La Plata *Miner* is sensible: It seems to us that a great deal of time is being wasted by persons who own valuable mines, in not getting them patented. We might mention several men who supposed that their mines were safe, as far as interfering claims are concerned, who have got into either expensive lawsuits or serious trouble, not from any discrepancies in their compliance with the law, but by some supposed informality whereby a shadow of right was given for some one to "jump" the claim or locate adjacent ground. The manifest remedy is to secure a patent as soon as possible, and thus prevent any such interferences, for if a mine is once patented, it is impossible to lay any conflicting claim on any part of its ground. We notice that around Mineral Point a great many mines are being patented, even those not considered first-class. This is as it should be. If a mine is worth working the first assessment, it is worth patenting, and if it is for sale this will increase its value at least 100 per cent.

PREPARATION OF PLATINUM BLACK WITH GLYCERINE.—If platinum chloride is heated with glycerine to the boiling point, it becomes dark red from the formation of chloride, a black precipitate of finely divided chloride following shortly after. On washing and drying, the precipitate has a grayish hue. This platinum black has little value, but if caustic potash is added in the preparation, an excellent product is the result. The best method of preparation is to heat together 15 cubic centimeters glycerine (25 to 27 degs. Beaume), and 10 cc. solution of potash (1.80 sp. gr.), and drop in 3 to 5 cc. solution of platinum chloride as soon as ebullition begins. The strength of the latter solution is that commonly used as a reagent. The operation occupies only a few minutes. The black precipitate is first washed with dilute hydrochloric acid, and finally with pure water.

SHIPMENTS OF BRITISH COAL TO SAN FRANCISCO.—The shipment of coal to this city from Great Britain, is said by a correspondent of the London *Times* to exceed anything hitherto known. Including that on the way from Australia the total quantity of coal due at San Francisco within the next four months is not less than 131,000 tons. The large fleet of grain ships coming from England carry coal as ballast, and dispose of it at a small profit when they reach this port. The effect will be partially, if not wholly, to close up the coal mines of this State, as they cannot produce coal at $5.50 or $6 per ton, the price asked for the imported article.

THIS is the style of newspaper puffs prevalent in the Black hills just now: "The superintendent of the Scalp Lock mine will accept our grateful acknowledgment of the receipt of a buckskin sack full of a superior quality of gold dust, the cleanest dust, we may truthfully assert, that has been sent to this office since the late rains, indicating that the mine is now paying much better than it did when the affable superintendent last spring sent us a carpet-sack full of sulphureted quartz and $17 gold dust. We wish the owners of this mine increased good luck in the future."

STATUE TO OERSTED.—A statue has just been inaugurated at Copenhagen to Hans Christian Oersted, as the first discoverer of the electro-magnetic power. Oersted has been dead more than 20 years. The statue, the work of the Danish artist, M. Jerichau, is placed on one of the boulevards surrounding the town, and represents the discoverer leaning against a pillar, holding in his hand a telegraph wire, against which he points a needle.

DEWEY & CO.

American & Foreign Patent Agents

OFFICE, 224 SANSOME STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, hook, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

PAUL'S DRY PROCESS.

I am now prepared to test gold and silver milling ores in any quantity from TEN POUNDS to FIFTY TONS, and assert my ability to prove, by machinery NOW UP, and open to public inspection, and by practical testing of its merits, that I can increase the yield of gold mills, working wet batteries and copper plates, from FIFTY to ONE HUNDRED PER CENT., and on silver ores a much larger percentage than by pan amalgamation, and at less expense than any known method of working quartz well; and from some "gold" ores of California can extract more silver extra with the gold, which is now lost, than all the expenses of mining and milling. Having had 25 years' practical experience in milling gold and silver ores, I presume to know whereof I speak, and AM PREPARED TO PROVE ALL I ASSERT. These mills, for simplicity, cheapness, practicability and perfection in working, challenge the skill of the age to surpass. Quartz miners who desire to investigate and have their ores tested, are invited to a critical examination of the machinery and process, and can receive permits for examination, particulars and pamphlets explaining process by calling at my office. ALMARIN B. PAUL,

Room 20, Safe Deposit Building, 328 Montgomery St

ERICH G. GAERTNER,

MINING ENGINEER.

All classes of mining properties reported on, consultations had on reduction of ores of all descriptions, plans for furnaces and reduction works furnished, and the construction of them superintended. Ore tests made at the office,

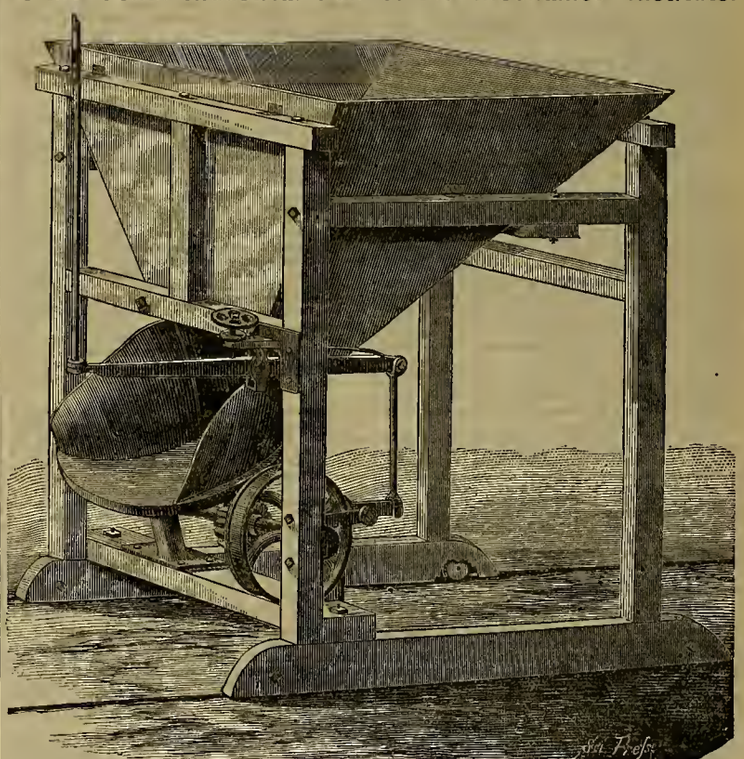
ANGELL'S CHARCOAL DENTAL SOAP for Whitening and Preserving the Teeth, J. W. ANGELL, Prop., San Francisco

$1,000 Challenge Ore Feeder,

AWARDED FIRST PREMIUM

At the Tenth Industrial Fair of the Mechanics' Institute.



It may be considered as now fully demonstrated, by careful and long-continued experimentation, that the plan upon which a perfect ore feeder must be constructed is that of the *carrier*, and not that of the shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane, or table, to the line of discharge, and there simply *dropped* Spasmodic or jerky contrivances will not answer the purpose.

REFERENCES.

A letter received from the Julian Mill, Newcastle, says, of the Carrier Feeder: "It is the most perfect Feeder we have ever seen; don't see how any mill can do without them."——A letter from Mr. O. C. Belding, of Amador County, speaks in the highest terms of them.——Two of the machines were shipped to the Bunker Hill Mill, also Gover Mill, Amador County.——Mr. Stevenson, of Boston Mill, Gold Hill, Nevada, says they are the best Feeder he has ever seen.——Soulsby Mill, Tuolumne County.——California Company, Nevada City.——Omaha Gold Mining Company, Grass Valley.——St. Patrick Mill, Placer County.

$1,000 CHALLENGE.

Backward in Coming Forward.

C. P. STANFORD FAILS TO COME TO TIME ON THE CHALLENGE OF $1,000 TO TEST THE MERITS OF HIS ORE FEEDER AS AGAINST MINE. THE CHALLENGE IS STILL OPEN TO HIM OR ANY ONE ELSE. *GENTLEMEN, PUT UP OR SHUT UP.*

We warrant the machines to give perfect satisfaction, and to be a better and more durable Feeder than any other in the market, and will sell them as cheap as any other of its class.

Continued from Page 365.

ture than at the present. On the 1650-ft level the rich ore is still widening ont to the eastward, seeming almost houndless in that direction. On the 1650-ft level the face of the south drift running through the center of the ore vein is still in ore of a fair quality. The mine, in fact, is showing well at every level, and has every prospect of aa rich or hetter returns for a year or more to come than it has ever yet afforded in the past. Sinking the C. & C. shaft ie making good headway, the hottom still in hard blasting rock. The flow of water is strong, hut it is now kept well under control with the pumps.

BELCHER.—Daily yield from 200 to 220 tons of ore. The ore hreasts and stopss are showing fully as well as usual and the pulp assays indicate a much better yield of bullion for the amount of ore crushed for the present month than has heen made for several months past. Sinking hoth the drain and air shaft and the main incline is making good progress. Thia is especially the case with the drain shaft, which has heen sunk a distance of 22 feet during the week. In the main incline the flow of water has heen very strong for several days past, giving considenble trouble on account of the great heat. At the hottom the thermometer standa at 130 to 136 degreee. The prospecting drifts on the 1600-ft level are all being pushed steadily forward, without change of intereet in any portion. Everything ie in fine working condition in and about the mine.

YELLOW JACKET.—On Thursday last a downcast was made of the south compartment of the shaft and all the air of the mine waa turned into the Imperial mine through the connecting drift on the 1940-ft lsvel. This necesearily created so much heat that all work had to he suspended on the lower levels for several days. It is now rapidly cooling off, and the starting of a draft of air through will no doubt greatly henefit both mines. A winze has been started on the north line on the 1740-ft level to cut a favorable seam of ore recently found in the east crose-cut on the same level. Sinking the new shaft ie making splendid progrssa, the bottom being in good sinking ground, and the work pressed ahead with great energy. It is now down 114 feet, and well timbered to the hottom

LEVIATHAN.—Cross-cut No. 1 has been started eastward from the main north drift on the 600-ft level to out and proopect the ore vein. This drift is now penetrating the black clay on the foot-wall of the ledge. The foot-wall has a pitch of 35 degrees to the eastward. The character of the material through which this drift is passing certainly warrants the helief that the ledge will not only be strong when cut, but that rich paying ore will be found.

JUSTICE.—Daily yield, 260 tons of ore, keeping the mills all running up to their full crushing capacity. The ore stopes extending from the 400 down to the 800-ft level were never yielding richer ore or showing better than at ths present time. The ore is extending both north and south on the 700 and 800-ft levels, and is richer in the hottom of the winze helow the 900-ft level than at any point on the levels ahove. The south drift on the 1000-ft level is making excellent headway, the rock in the face gradually getting softer, with every appearance of a near approach to the ledge. No change in the face of the north drift on the 1000-ft level.

WARD.—Sinking the shaft is making good progress, the bottom still in good hlasting ground. The flow of water is light and gives but little trouble. The face of the south drift from the Julia, on the 1600-ft level, running to connect with the bottom of the shaft when it shall reach that depth, is in quartz of a fine deecription.

NORTH CON. VIRGINIA.—Sinking the shaft is going ahead with all possihie energy, the bottom in soft ledge material. The pumps are all in, down to the 1100-ft station, at which point a sta ion is being opened, ready, when everything ia in readiness, to commence drifting for the ore vein.

SUCCOR.—The erection of ths new pumping engine is progressing splendidly. It is now confidently expected to turn on steam hy a week from to-day. The pumps and pump columns are hsing placed in the shaft, and are nearly all ready for use.

SILVER HILL.—Sinking the main incline shaft is making about two feet per day, the rock in the bottom being extremely hard and tough to hlast. The north drift on the 444-ft level is advancing at the rate of four to five feet per day, the face in ledge material. This drift is now within about 160 feet of the Justice South line. The flow of water from this drift is very slight. The water in the hottom of the main incline also gives but little trouble.

SIERRA NEVADA.—The flow of water at the hottom of the shaft is still quite strong, hut it is kept under good control hy the pumps. The north and south drifts on the 1700-ft level are each steadily advancing, without any important change. The prospecting drifts on the third, second and first station levels are all advancing at the usual fair rate of apeed, there heing no changes worth noting in any of them during the week.

CHOLLAR-POTOSI.—Daily yield, 100 tons of ore, the assay value of which is $30 per ton. Sinking the main incline shaft is making stsady progress at the rate of two and a half feet per day. The rock in the bottom blasts ont finely and the flow of water gives but little trouble. Sinking the combination shaft is making splendid progrcs, the rock in the bottom working well. The erection of the new pumping machinery is rapidly approsching completion.

SUTRO TUNNEL.—Face of header in hard porphyry, with frequent small seams of quartz and clay. The drills are working to very good advantage in this material. Total length of tunnel, last evening, 14,107 feet.

UTAH.—Sinking the main shaft is making vigorous progress, the hottom in good hlasting ground. It ie now down 665 feet hslow the 400-ft station. The water gives no trouble whatever.

CALEDONIA.—Sinking the shaft is making good progrcse. The north drift on the 1100-ft level ie passing through favorahle ledge matter.

KOSSUTH.—The prospects of finding a large body of good paying ore in the north drift on the 600-ft level are daily hrightening. The prospects of the mine are ahowing hett-r every day.

TROJAN.—The ore body on the 300-ft level has been opened on a width of 30 feet, and is of a fine character. Stopes are now being opened on the ore body for milling purposes.

UNION CON.—The face of the north drift on the 1300-ft level ehows no change of value. The ledge material in the face of the west cross-cut from thia drift is showing less favorahle.

PHIL. SHERIDAN.—Sinking the shaft is going forward in good earnest. The bottom is still in ledge material. The water gives but little trouhle.

AMAZON & GLASGOW.—The combination joint shaft is down a distance of 430 feet, the hottom in vein material of a fine character. Every foot that the shaft is aunk the ledge shows improvement.

GOULD & CURRY.—The new pumping engine is hsing placed on its bed ready for services. The old pumps have all been taken from the shaft, the shaft repaired and the pump stations put in order for the reception of the new pumps. Everything is being put in order on the 1700-ft level for some live work in a very short time.

BEST & BELCHER.—All parts of the mine are being put in the heet of working condition. Things are assuming a business look on the lower levels, and the appearances are that if there ie anything to he developed in that portion of the mine, it will not hs a very great while before it will he found.

LADY BRYAN.—The stone foundatione for the new pumping machinery are complete, and the placing of the machinery has heen commenced. The large new hoisting works building is finished and ready for the storms of winter. Work at all points is being pushed with great energy.

IMPERIAL CONSOLIDATED.—Slnking the north winze below the 2000-ft level is making fair headway. The east crosecnt on the 2000-ft level is advancing rapidly, the face of the drift in very favorahle ledge material. The north drift on the 2136-ft level is making good progress. No change.

OVERMAN.—Sinking the main shaft is making splendid progress. The north and south drifte on the 1200-ft levels are each steadily advancing, with very favorable prospects of ore developments ahead. The erection of the new pumping engine is making excellent progress.

ROCK ISLAND.—The old pumps and columns have all heen taken out of the shaft and the works shut down until the new pumps are ready to place in position. Preparations for the erection of the new machinery are going ahead at a very favorable rate.

WEST BELCHER.—During the past week the main drift at the 300-ft level has been running into a fine deposit of high grade ore, with no weet wall as yet. Assays of from $50 to $600 are easily obtained, and milling the ore will be commenced next week.

PROSPECT.—Very good headway has been made with the main drift west at the 400-ft level, and it is in to-day 152 feet. The material in the face of the drift shows still more favorahle indications of being near the ledge. No water coming in aa yet.

CROWN POINT.—sinking the main incline is making excellent headway, the rock in the bottom blasting out well, and the Burleigh drills doing splendid execution. Retimbering a portion of the shaft is also being carried forward at the aame time.

COSMOPOLITAN.—The various stopes and ore breasta continue yielding their usual good quantity of ore. The north drift from the incline, hslow the main adit or tunnel level, continues in good ore, and the south drift at that point shows improvement.

SAVAGE.—The pumps have heen kept hsay during the week with varying success. Sometimes the water wenld rise or apparently gain on the pumps, while at other times it would recede for a number of feet. The gain is steady though slow.

ALTA.—Sinking the shaft is making splendid headway, the rock in the hottom being much softer than it has heen for eome time past. The flow of water ie light, and the prospects for striking the ledge are growing better every day.

BUCKEYE.—The north drift on the 350-ft level is being pushed forward, the face of the drift being still in ledge material mixed with quartz and occasional streake of good ore. Nothing doing in any other portion of the mine.

LADY WASHINGTON.—Main drift east croee-cutting the ledge is now in 172 feet from the 850-ft station. Streaks of low grade ore are making their appearance in the face of the drift, indicating very near proximity to the ore vein.

MEXICAN.—The prospecting drifts on the 1465-ft level continue to show a steady improvement. There is no change worth noting in the west cross cut on the 1300-ft level.

WHITE PINE DISTRICT.

MINING INTEREST SOLD.—White Pine *News*, Nov. 25: We are informed that the owners of the Boston mine, situated but a short distance from Hamilton, on the north side of Treasure hill, have sold one-half of their valuable mining property to Jack Gilmer, of the stage firm of Gilmer & Salisbnry. The old owners of the mine were unable to develop it for want of capital, and concluded to eell a portion of it and have the mine developed. We understand that a contract will be immediately let to sink a shaft 200 feet deeper than the present workings. The company, as now formed, will have an abundance of capital for all practical purposes and will develop a mine that has long had the reputation of being one of the best properties in the district. The Boston was formerly the Virginia, but was relocated nearly two years ago. The San Francisco company who originally owned the Virginia mine took ore from it which yielded them many thousands of dollars, and it has heen a wonder to many why they abandoned the mine and allow it to be relocated.

Arizona.

KIT CARSON.—Arizona *Miner*, Nov. 17: Christman & Co., we learn, are down some 30 feet on the Kit Carson mine, and find no difference in the character of the vein matter between it and the Silver Flake, which it adjoins, and think the one is a continuation of the other. They are taking out good pay ore in considerahle qnantities. The ledge has become sufficiently solid as to require hlasting. Report says the ore taken to Agua Fria furnace from this mine, has run all the way from $600 to $1,200 to the ton.

BULLION SHIPMENT.—On Satnrday, Dr. Goodfellow, superintendent Aztlan mill, sent to the office of the Peck mining company the result of four days' run with five atampe, for account of Anders & Rowe. There were six hars of silver hullion from Peck ore, weighing in the aggregate 8,446.30 ounces. Assay value, $10,-865.06. Average fineness, 994.

THE Accidental mine, on Lynx creek, continues to turn out gold bullion in paying quantities. The Thunderholt mill, which works the ore from this mine, is a steam engine driving arastras, and though hut little haa been said ahont it, it is helieved that throughout the season it has, perhape, paid as well, in proportion to the capital invested, as any property in the Territory.

MR. MORRISON, snperintendent; S. M. Weesels, foreman; John Rohinson and Mr. Nash, brick-layers, are in from Walnut Grove, and report the Pinal company's furnace about ready to start np. They are now only awaiting the delivery of charcoal and ore, which will probably be on the ground within a week, when we shall hear the result of their first run on Crescent ore.

Idaho.

A NEW BONANZA.—Owyhee *Avalanche*, Nov. 25: W. J. Bolin made a discovery a few days ago near his ranch, about five miles from town that he thinks will ultimately make a millionsire of him. He stumbled on a very rich lead which he says is a continuation of the chain of ledges near Wagontown. It ahows up, however, much better than any of those ledges, being unusually prolific in silver. He had a sample of the croppings assayed and the result is very satisfactory.

THE BELLE PEOR.—Work is heing vigorously prosecuted at this mine and with the most promising prospects aa usual. Stoping is going forward and winzes are heing sunk. The rock taken out recently shows np richer in gold than any of the installments from the B. P. during its most palmy days. Next week a large quantity of the ore will be forwarded to the Shoemaker mill for crushing, and the owner of the mine, Mr. Peck, whose judgment is very correct in such mattere, predicts that the clean-up will surpass in richness any of the previous products of this famous mine.

Montana.

NEW MILL.—Butte *Miner*, Nov. 14: The boiler and engine and some other machinery for the 10-stamp mill of Mr. A. J. Davis arrived on the ground last week. Mr. Davis informe us that the works will be in operation hy Christmas without doubt. He has about 20 tone of salt now in store here, and 100 tanks of quicksilver in transit, which will arrive in a few days, so that any delay for want of these articles is out of the question. Also 700 cords of woods have been contracted for.

WE are informed hy a reliable party that Mr. T. H. Manning has leased the Centennial mill for an indefinite period, and he will have entire control of its workings. Mr. John How departed for the East this morning, we understand, to hs absent for several weeks.

FROM Mr. McDermott, who for some time has been in the employ of Supt. Masten, of the Monroe silver mining company's works, at Dewey's flat, we learn that the new mill was started up a week ago last Friday, on ore from the company's leads. Everything moved off as smooth and regular aa clock work, and the people over there are much elated with the prospects for a lively and prosperous camp in consequence.

Proceeds of Comstock Mines.

We append the table showing ths net yield of the minss of ths Comstock which lie in Storey county, for the qnarter ending September 30th, 1876. The tahle was published in the Gold Hill *News*, and taken from the returns of Rohert Gracey, Connty Assessor. The yield of the mines will be greatly increased during the current quarter in both departments, as the Consolidated mill has heen completed and is running to its full capacity, and the Omega mill, in Six-Mile canyon, is kept constantly employed on tailings:

ABSTRACT STATEMENT

From the Quarterly Assessment Roll of the Proceeds of the Mines of Storey County, Nev., for the Quarter Ending September 30th, 1876:

MINE.	No. of tons extracted.	Value per ton.	Gross yield or value.	Total cost.	Amount deducted by law.	Net yield or value on which taxes are levied.	Total amount of tax.
Belcher	30,336	$18	$568,376 10	$568,418 00	60 per cent.	$113,395 22	$2,778 18
California	53,001	97	5,156,023 84	1,445,468 43	80 per cent.	8,710,658 41	72,356 39
Con. Virginia	16,600	97	1,638,308 54	1,145,136 64	60 per cent.	613,323 45	11,999 81
Gholler-Potosi	6,720	19	129,939 47	217,047 88	80 per cent.	25,999 59	605 59
Crown Point	4,763	53	254,516 35	170,000 60	80 per cent.	13,116 27	321 81
Con. Imperial	6,911	312	2,214,971 35	1,483,533 60	..... per cent.	61,623 61	1,207 33
Ophir	6,011	85	963,095 72	601,897 00	60 per cent.	385,838 94	7,563 92
Overman	27,358	25	11,393 46	72,858 44	80 per cent.	2,278 69	53 83
Total	439					$5,013,841 92	$99,151 51

The assessor also makes an abstract statement of the proceeds of the tailings works in the same county for the same qnarter:

Bossel Bros. worked 390 tons; value per ton, $7; gross yield or value, $2,730; total cost of redncticn or sale, $2,875; amount deducted as provided by law, 90 per cent.; net yield, $273.

J. C. Courser worked 78 tons; value per ton, $13; gross yield or value, $1,061; total cost of reduction, $1,092; amount deducted, 80 per cent.; net yield, $212.20.

Express mill worked 3,460 tons; value per ton, $8; gross yield, $29,118; total coet, $25,-982; net yield, $3,136.

Andrew Elholm worked 200 tons; value, $9 per ton; gross value, $1,870; total coet, $2,200; amount deducted, 90 per cent; net yield, $187.

G. N. Jennings worked 72 tons; valne per ton, $13; gross yield, $677; total cost, $868; amount deducted hy law, 80 per cent.; net yield, $195.

C. C. Stevenson worked 480 tons; valne per ton, $5; gross yield, $2,400; total cost, $1,920; net yield, $480.

Railroad mill worked 5,600 tons; yield per ton, $8; gross yield, $45,677; total cost, $41,-742; amount deducted, 90 per cent.; net yield, $4,567.

Watson & Co. worked 80 tons; yield per ton, $15; gross yield, $1,200; total cost, $1,120; amount deducted, 80 per cent.; net yield, $240.

REPORT OF CHIEF OF ENGINEERS.—The annual report of the Chief of Engineers has been completed. Among the estimates for appropriations which he earnestly recommends are the following: For completing the defeusive works at Fort Point, San Francisco harbor, $60,000; fort at Lime point, $80,000; Fort Alcatraz, $50,000; fort at San Diego, $50,000; Fort Stevens, Columbia river, $20,000. Of the amount of appropriations for public works on the rivers and harbors for the next fiscal year, certain allotments have been made in compliance with instructions from the Secretary of War. Among them were the following: Improvement of Oakland harbor, $35,000; Upper Willamette river, $30,000; Lower Willamette and Columbia rivers, $20,000. The report itemizes detailed accounts given by various officers of the river and harbor improvements now in progress under their respective managements, together with the statements of the amounts which these officers estimate can he profitably expended during the next fiscal year. Among theee items are the following: For the improvement of Oakland, California, $250,000; Lower Willamette and Columbia rivers, Oregon, $150,000. In transmitting the statements of his subordinates regarding the two latter amounts, Humphreys makes no recommendation of his own concerning them.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

FOR WEEK ENDING NOVEMBER 21ST, 1876.

FLOUR BOLTS.—Henry C. Hurd and Geo. Simpson, Redwood City, Cal.

COPY HOLDERS.—Harrison H. Hendrix, San Jose, Cal.

BALING PRESSES.—Allen D. Miller, Sacramento, Cal.

PROCESSES AND APPARATUS FOR RENDERING ORES.—Wm. H. Sterling, S. F.

COUPON NIPPERS AND TICKET PUNCHES.—Frank Walkar, Santa Barbara, Cal.

FRUIT BOXES.—Chas. W. Weston, S. F.

SPRING BEDS.—Chas. Curtis Allen, S. F.

ENDLESS ROPE RAILWAYS.—ASA E. Hovey, S. F.

VEHICLE SEATS.—Frederick Oppenheim, S. F.

———*The patents are not ready for delivary by the Patent Office until soma 14 days after the date of issna.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time poesible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained throngh Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

FEEDER FOR THRESHING MACHINES.—William Hutohings, Fresno, Fresno county. This invention relates to an improvemsnt in that olass of feeders for threshing machines in which reciprocating bars or arms are used, thess arms being provided with teeth or projections, and having a reciprocating or curvilinear motion within the trough or shute which leads to the threshing oylinder, so as to force the straw forward to the cylinder. The invention oonsists in the use of four slides, which are secured together in pairs, having spikes or fingers upon their upper surfaces. These slide forward and back upon the floor of the incline, one pair upon one side and the other on the opposite side of the inclined trough, thereby feeding the straw by a series of alternate movemente at one side and the other of the trough, which is the most important feature of the improvement, as it renders the feeder a snocess over those which simply employ a series of hars extending across the trough and moving alternately. The bars pass through a vertical partition in the rear, and are connected with operating oranks from the rear, so that the floor is not perforated and will not waste grain. In combination with this device Mr. Hutchings employs a series of arms which project from a horizontal shaft just above the month of the machine, and these arms are arranged in a spiral form about the shaft, so that one end of the spiral will enter the mass of straw and assist it forward while the slides at that side are being withdrawn, while the other end of the spiral will operate as the other pair are withdrawn. The operation of this feeding device is as follows: The straw is fed into the trough, where the slides with their fingers force it forward, the pair on one side serving to move it downward while the other pair are being drawn back. The action is a vibrating one, the mass of straw being pushed forward at one end and then at the other. The fingers, from their horizontal positions, are easily withdrawn when the slides are drawn hack, and never pull the straw hack or stop it; and the rotation of the spirally arranged arms is so fixed that those on each pair of slides will take hold of the straw when the slides are drawn back, thns assisting in the feeding. By the method of operating the slides in two pairs the straw will be easily fed forward, as there is no necessity of pulling it apart and separating the fibres, as would he the case if a system of slides were used and every alternate one moved forward while the others moved hack.

IMPROVED "GAG RUNNER."—William M. Blain, Salinas City, Monterey county. This invention relates to a novel construction of a gag rnnner and a hrow band loop for harnessing in one piece, which may have an ornamental rosette attached to it or not as may be desired. The check-rein passes through a metallic loop at the inner end, which loop is gradually flattened out, and at the end of this flattened portion a loop is turned np to receive the hrow hand. These loops are all made in one piece, of malleable iron, and may he used without any additional part. If, however, it is desired to attaoh a plate to the device, the plate may he made with projecting flanges, between which the flattened portion slides and is held in place by means of a shoulder upon its hack. By this means the inventor is enabled to form the two loops in one piece, and when the plate is used it may he made without the usual loop, which is to he soldered or otherwise made fast to it.

FRUIT KNIFE.—George Tarleton, San Jose. This consists of a novel attachment to knife blades, the object of which is to out out and remove the parts of such stoned frnit as peaches, prunes, etc., at the same time that the knife blade cuts the fruit in halves. The pitting attachment for the knife hlade consists of a semi-circular steel or other metal blade, the convex side of which is secured at its middle

to the cutting edge of the knife blade about two and a half inches from the handle, so that it forms two narrow curved blades, one of which extends upon each side and projects in front of the cutting blade. To pit the fruit the knife is taken in one hand and the fruit to be cut in the other. The operator then cuts through the fruit with the ordinary blade in the crease which surrounds all stoned fruits, commencing near the depression at either end, and after the blade has been inserted until it strikes the stone it is drawn towards the operator until the curved blade enters and partially surrounds the stone or pit. The fruit is then rotated, allowing the blade to follow the crease until the fruit has been cut to the pit entirely round its circumference. During this operation the transversely curved blade follows inside of the fruit, cutting around the pit, as the large blade cuts the meat, so that when the fruit is cut in halves the pit is entirely free. The inventor says this cutting blade could be attached to a circular knife and the circular knife rotated around the fruit and thus a machine can be made that will automatically halve and pit fruit; but for ordinary work the knife itself, operated by hand, is sufficient.

WATERPROOF SIGNALING APPARATUS AND KEY.—William Lundberg and Daniel F. Leahy, Portland, Oregon. The improvement comprises a novel signaling apparatus and key, which are intended to be used by fire companies in order to establish a speedy communication from the engine along the line of hose, or by sub-marine divers, or in any other place where a line of signals must be established speedily from place to place. It consists in the employment of an elastic tube which contains one or more insulated wires. This tube is wound upon a reel from which the necessary connections are made between the wires and battery, and the opposite end of the tube has attached to it the waterproof key by which communication may be made with the engine at will. The peculiar key consists of an enlarged extension or ball, secured to the end of the hose. Within this tube are placed two metal plates, and one of the wires is secured to each plate so that they do not touch. Opposite to these terminal plates is another plate, which is connected with a button upon the outside of the ball. When this ball is compressed by pressing upon the button the plates are forced into contact with both plates, thus completing the connection. When the pressure is removed the elasticity of the tube breaks the connection.

TABLE NAPKIN HOLDER.—Benjamin F. and V. A. Hardy, S. F. The object of this invention is to provide a convenient implement for attaching one corner of a table napkin to the neck of the wearer, so that the napkin will be kept across the breast of the person using it at the table, to prevent the clothing from becoming soiled during the meal. The usual and most common way to do this is to tuck a corner of the napkin down under the collar, but in this case it sometimes falls into a plate of soup, and otherwise behaves in a disagreeable manner. The device in question consists of a clamp and hook combined in one implement, so that the corner or edge of the napkin can be gripped or held by the clamp, and the hook passed over the neck-band of the article of clothing, thus effectually attaching the napkin so that it can be spread across the breast and confined in any suitable manner.

SPARK EXTINGUISHER.—J. W. Donaldson and Allen C. Miller, Fairfield, Solano Co. The improvement relates to a novel means of extinguishing the sparks and cinders which escape from the furnaces of engines, and by its use the danger which arises from fire in harvest fields and other places is avoided. The invention consists in the application of a jet or spray of vapor within the smoke-stack or chimney through which the sparks escape, and by this means they are all extinguished before leaving the chimney.

STUMP PULLER.—J. B. Forbes, Clympia, W. T. This machine for pulling stumps consists of a sled frame which is provided with adjustable wheels, which can be raised or lowered when desired, so that the machine will rest upon the wheels. A capstan or windlass is mounted upon the frame and convenient methods of sinking the devices are supplied. This machine is quite simple and can be used for various purposes besides stump pulling. By ingenious means plenty of power is supplied for the work it is required to do.

MECHANICAL POWER.—Henry G. Gastmann, Eureka, Humboldt county, Cal. This invention relates to a novel improvement in mechanical process which the inventor calls the "diamond lever power," and it consists in the combination of levers, which form a series of parallel lever movements having a gradually increasing stroke. This mechanism is connected with one main lever, and is operated by a pitman from a crank upon a driving wheel.

WINDOW SASH BALANCE STOP AND LOCK.—B. M. Whiting, Los Angeles. This is an arrangement of coiled springs inside of boxes, which are inserted inside of the window casing for raising and lowering the window instead of the ordinary sash cord, weight and pulley. A small attachment to the same device serves to lock the sashes in any position to which the sash is raised, either up or down. The device is quite simple, inexpensive, neat and convenient.

General News Items.

THE STATE OF Daniel Webster, in New York, was unveiled on Saturday last.

DISASTROUS freshets have occurred between Panama and Aspinwall.

THERE are 18,000 Israelites in San Francisco, five synagogues in the State, and three in the city.

THERE will be about 22 whaling vessels in the Pacific next season, to take the place of the fleet lately abandoned.

Two criminals were publicly whipped and exposed in the pillory at Newcastle, Del., on the 25th inst., receiving from 20 to 40 lashes each.

SUBSCRIPTIONS in Petersburg and Moscow alone, to the loan of 100,000,000 roubles, authorized by an Imperial ukase of November 18th, exceeds that amount.

A TELEGRAM from Columbus, Ohio, announces the death, on Friday, on the train, of Commodore Paul Shirley, U. S. N. Deceased was en route to Memphis to visit his sister, Mrs. Rice.

PLOWING WITH DYNAMITE.—The agents of M. Nobel, the well-known inventor of nitro-glycerine, have lately found a novel use for dynamite in grape culture, which suggests further possibilities. The mechanical way, literally to "shake up" the earth, and allow the free percolation of water and the access of air to the roots of the vines. To this end holes were made in the soil about ten feet in depth, and at points where no roots were likely to be injured. Then cartridges of dynamite were introduced and exploded, and the result was that for the entire depth noted the earth was made loose and friable. The ground, in fact, was not only rendered in better condition than could have been effected by plow and harrow; but every phylloxera, so the writer says, on roots of the vines was killed. The quantity of dynamite used is not stated, but it is likely to have been but small, just enough to shake the soil without blowing up the vines.

KNIGHT'S American Mechanical Dictionary is a book for all persons who make, buy, sell, use, or want to know anything about tools for machines, or are curious as to the history and development of mechanic art. It is a descriptive word-book of tools, instruments, machines, chemical and mechanical processes; civil, mechanical, railway, hydraulic and military engineering; a history of inventions; general technological vocabulary; and digest of mechanical appliances in science and the industrial and fine arts, etc. For circulars or price address or apply to A. Roman & Co., wholesale and retail booksellers, 11 Montgomery street, San Francisco.

SULPHUR BATHS three cents. The beneficial results of sulphur baths are too well known to require comment. The effects of GLENN'S SULPHUR SOAP in the bath are identical, completely deodorizing offensive accumulations, and thoroughly purifying the entire surface of the body. Sold by druggists, 26 cents.

WOODWARD'S GARDENS embraces an Aquarium, Museum, Art Gallery, Conservatories, Tropical Houses, Menagerie, Seal Ponds and Skating Rink.

Superior Photographs.

To be sure of a good picture, you have only to patronize G. D. Morse's Palace of Art, at No. 417 Montgomery street, S. F. The publishers of this journal have patronized Mr. Morse for many years, and do not hesitate to say that his pictures are not excelled by any we have seen produced in this or any other country. No one can ask for a better man to patronize than Mr Morse. He is affable and respectful to all.

WOODLAND, CAL., Aug. 8th, 1876.

MESSRS. DEWEY & CO.—*Gents:* Your letter containing the patent for my Centennial churn has come duly to hand, and you will please accept my many thanks for the prompt manner in which you attended to the business intrusted to your care, and I will take great pleasure in recommending you to any one having anything to attend to in your line. I am having a number of the churns put up, which will be ready for sale in a few weeks. Yours truly, JAMES ROOT.

GIVE YOUR FULL ADDRESS when you communicate on business to this office, especially in returning newspapers. The fact that your name is on our subscription list is of no assistance to us. Without sending your post office address we should have to look over thousands of names to find yours.

BOUND VOLUMES of the MINING AND SCIENTIFIC PRESS from Jan. 1st, 1864, are for sale at this office at $5 per volume, two volumes a year. Unbound at $3 per volume.

SEWING MACHINES.—We have a first-class machine we wish to dispose of on favorable terms. Apply at this office.

To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect July 1st, 1874, provides that in addition to the regular publication, daily or weekly, of the assessment and sale notices as heretofore,

PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where the principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

DEWEY & CO., Publishers.

GOOD PRINTING INK.—We prefer Chas. Eneu Johnson's printing inks, having used them on this paper for the past four years. H. S. Crocker & Co., printers, stationers, blank book and paper dealers, are Johnson's S. F. agents.—DEWEY & Co., Publishers.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Office Cascade Blue Gravel Mining

Company—NOTICE:—A meeting of the stockholders of the Cascade Blue Gravel Mining Company will be held at the office of the company, 311 California street, rooms 3 and 4, second floor, San Francisco, Cal., on Monday, November 20th, 1876, at two o'clock P. M., for the purpose of disposing of the company's stock, and authorizing the sale of the entire property of the company, with any other business that may come before said company. R. F. KNOX, President.

J. M. BUFFINGTON, Secretary.

San Francisco, Oct. 13th, 1876.

Eagle Quicksilver Mining Company.—

Location of principal place of business, San Francisco, Cal. Location of works, Santa Barbara Co., Cal.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 9), levied on the 30th day of September, 1876, the several amounts set opposite the names of the respective shareholders, as follows:

Names	No. Certificate.	No. Shares.	Amount.
Colburn, T W	unissued	3	$760 00
Hawley, E R	unissued	1	250 00
Watson, Wm. H	unissued	1	200 00
Paine, Geo	unissued	5-18	78 12½
Paine, Orlando	unissued	6-18	78 12½
Erskine, Laura	unissued	4-18	62 50
Erskine, Laura Paine,	unissued	2-16	31 25

And in accordance with law, "the articles of agreement of said company," and an order of the Board of Directors, made on the 30th day of September, 1876, the whole or such undivided part of each delinquent share in said mines as may be necessary, to pay said assessment upon each, will be sold to the highest bidder, at public auction, for cash in United States gold coin, at the office of the company, rooms 6 and 6, No. 302 Montgomery street, San Francisco, Cal., on Monday, the fourth day of December, 1876, at the hour of one o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale. WM. H. WATSON, Secretary.

Office, Rooms 6 and 8, No. 302 Montgomery street, San Francisco, Cal.

Golden Sun Gold Mining Company.—

Notice is hereby given that the regular annual meeting of the stockholders of the Golden Sun gold mining company will be held at the office of the company, No. 302 Market street, (up stairs,) San Francisco, Cal., on Monday, the 11th day of December, A. D., 1876, at one o'clock P. M., for the election of Trustees of said company for the ensuing year. The transfer books will be closed on December 4th, 1876, at three o'clock P. M., and remain closed until after the meeting. By order of the President.

JOSEPH PENTECOST, Secretary.

Mariposa Land and Mining Company

of California. Location of principal place of business, San Francisco, Cal. Location of works, Mariposa county, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the ninth day of November, 1876, an assessment, No. 8, of one dollar per share was levied upon the capital stock of the corporation, payable immediately, in United States currency, to the Secretary at the office of the Company, room 33, Nevada Block, No. 309 Montgomery street, San Francisco, Cal., or to the Assistant Secretary, at the office, No. 9 Nassau street, New York, N. Y.

Any stock upon which this assessment shall remain unpaid on the 11th day of December, 1876 will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the eighth day of January, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors

LEANDER LEAVITT, Secretary.

Office, Room No. 33, Nevada Block, No. 309 Montgomery street, San Francisco, Cal.

Cerro Bonito Quicksilver Mining Com-

pany. Location of principal place of business, San Francisco Cal. Location of works, Cerro Bonito mining district, Fresno county, Cal.

Notice is hereby given, that at a meeting of the Board of Directors held on the 13th day of November, 1876, an assessment (No. 1) of four dollars per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, 418 California street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 18th day of December 1876, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the eighth (8th) day of January, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors

J. W. CLARK, Secretary.

Office, Room No. 2, 418 California St. San Francisco, Cal

GEO. PARR, Buffalo, N. Y.

DUNHAM, CARRIGAN & CO., San Francisco, are Sole Agents in California for my Heavy Wood Working Machinery.

THE O'HARRA

CHLORIDIZING FURNACE.

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cnpola furnaces.

Coet of Roasting and Chloridizing by thie Procese:

Two cords of wood at $6	$12.00
Two firemen at $4	8.00
1500 lbs of salt at 1½c	22.50
Wear of shoes and power	1.50
Cost for 15 tons	$44.00
Cost for one ton	2.93⅓

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working snccessfnlly at the Poe Consolidated Co.'s mines, in the Peavine District. For further information, apply to

D. J. O'HARRA,

Reno, Nevada.

PICKERING ENGINE GOVERNOR.

Vallejo Fonndry, October 17th, 1876.

MESSRS. NEYLAN & YOUNG, San Francisco,

Agents "Pickering Governors."

Gents:—The 10 two-inch Improved Speed Adjusting Governors I bought of yon this year for my Patent Straw Burning Threshing Engines give splendid satisfaction. They far snrpass for regularity of speed any Governor that I have ever seen, and I have seen all of the best kinds; I have seen the main helt fly off the pulley several times this season while threshing, and the engineer did not discover it, so perfectly was the speed maintained, until he was told of it; this I consider something wonderful; I consider the Governor absolutely perfect, so far as speed is concerned. I bought, and put on to one of my engines a Shive Governor, to see which was the best. and after one season's trial I have no hesitation in saying they are as far superior to the Shive, or any other Governor that I have seen or nsed, as the Shive Governor is to the old Butterfly Valve Governor. I wish yon wonld send me the lowest price that you can furnish 25 Governors for next season's engines.

Yours, respectfully, I. L. HEALD.

LOOK

The Great Western Scroll Saw Co.'s New and Improved $5.00 Foot and Steam Power Scroll and Bracket Saw is the best one yet invented. With it men and boys are making from $3 to $10 per day. We will send yon a Machine, six Saws, 15 Patterns and two feet of prepared wood on receipt of $5. Address,

GREAT WESTERN SCROLL SAW CO.,

Leavenworth, Kansas.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND-POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING and TUNNELING DRILLS, with or without power, at short notice, and at redneed prices. Ahundant testimony furnished of the great economy and snccessful working of numerous machines in operation in the quartz and gravel mines on this coast. Circnlars forwarded, and full information given npon applicetion.

Mining and Scientific Press.

THIS PUBLICATION, SO VALUABLE FOR MINERS, MECHANICS AND MANUFACTURERS,

Will enter npon its THIRTY-THIRD Semi-Annnal Voinme on Saturday, Jannary 6th, 1877. It has ever been and will still continue to he the aim and object of the pnblishers to make the PRESS

A Practical and Interesting Journal.

To this end, we aim, through the constant watchfulness of onr editors and correspondents, to sieze npon everything new in the way of mining and the various processes connected with the saving and separating of the precious metals, and place the same before our readers at the earliest day. It has been well said that

A Newspaper is a Window

Through which men look ont npon all that is going on in the world. Our window is a special one, so placed and arranged as to bring within the scops of its vision all that is going on

In the World of Mining, Mechanics and Science.

Without a paper of this kind, the miner or mechanic is shut up in a small room or shop and can know bnt little of what is going on in the world around him in relation to his particular calling. In this age of rapid progress hooks are necessarily slow and behind the times. It is only through papers devoted to the speciality which he has chosen that one can be easily apprised of the discoveries and improvements which are constantly being made by his fellow workers, and without a knowledge of which he soon becomes a lag gard in the race.

The Value to the Community

Of snch pnblications in disseminating important information, in checking useless and exploded experiments and in instigating important enterprises, can scarcely be overrated. Through them the readings and observations of thonsands are collected and collated, and brongbt directly to the shop or table of the reader without any effort of his own. For a mere trifle of cost he is regularly furnished with an encyclopedia of jnst the information he needs—an unhound book forever issning but never finished.

Nowhere in the Wide World

Is snch an aid more needed than by the miner of California. It is needed alike in the mill, in the mine and in the placer. We have here

The Largest Mining Field on the Globe,

Embracing a variety of minerals nowhere else found within the boundaries of a single field. We have here also, men gathered from every quarter of the globe, bringing with them the collective wisdom of the world,

Useful, Practical and Directly from the Field

Of labor. The mnstiness of books has been brushed away, and their minds are stored not only with the experience of the past, but also with the practice of the present. It is to this fact that we are indebted for our present

Able List of Correspondents,

Through whom we are able to promise to our readers so much that cannot be collected in the mere routine of office work. By the aid of snch help our editors will be able, dnring the coming year, to do more than ever in furnishing information which shall be

Fresh, Novel and Interesting,

And which shall comprise all that is known of the latest and best means for saving gold and silver, and for economizing labor and cost in that direction.

Our Illustration Department

Will still continue to form an important feature, and no effort will be spared to make it of the greatest possible local and general interest to onr readers. The important matter of

Home Manufactures and Inventions

Will also largely occupy the attention of the publishers and editors, and will be constantly encouraged, as an important means of furnishing employment to those who are seeking our shores, and adding to the wealth of the Pacific coast.

The Large and Increasing Circulation

Of a journal thus devoted exclusively to useful and practical information, speaks more in our behalf than anything we could say of ourselves, and is an encouragement to its further increase, especially in these times of trifling and trashy journalism.

The class of readers who are interested in such a publication as this, have no need to be anything more than merely reminded that such journals are necessarily more costly than those of a lighter class, such as are read by the "million" and thrown aside as soon as read. Considering the character and location of the MINING AND SCIENTIFIC PRESS, our rates are as favorable as can possibly be afforded and do justice to the great industries in aid of which we are laboring.

A Handy Map

Of California and the principal portion of Nevada will be furnished free to all subscribers who pay one year in advance, during the year 1876. The map is plain, printed on tinted paper, about 16x20 inches, showing townships in California, and the counties, railroads and principal towns in California and Nevada.

We Prepay the Postage

On all papers sent to subscribers in the United States. SUBSCRIPTION RATES, payable in advance: One year, $4. Sample copies free to those who will assist in obtaining subscribers.

DEWEY & CO., Publishers,
No. 224 Sansome street, S. F.—Jan. '76

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,
MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose position is unsurpassed in his specialty.

Price $2.50 coin, or $3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly steemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also sbounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy,

Containing 672 Pages and 83 Engravings

BY J. S. PHILLIPS, M. E.,

Of California, a Practical Operator for Thirty-four Years: Explorer, and Resident in the Pacific States and Territories for the past Eight Years.

PRICE, bound in cloth, $10.50; in leather, $12. Forwarded by mail for 50c. extra, at the MINING AND SCIENTIFIC PRESS Office, by

DEWEY & CO.

"SPEAKS WELL," ETC.—We would return thanks for an exchange and back numbers of the MINING AND SCIENTIFIC PRESS, published by Dewey & Co., of San Francisco, Cal. It is a well edited, interesting, and valuable journal, and speaks well for our Pacific neighbors.—*U. S. Milling and Manufacturing Journal.*

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, DECEMBER 9, 1876.

VOLUME XXXIII. Number 24.

Items of Interest from the Mines.

We give below items of interest from prominent mines, most of which are colleted from letters of the respective snperintendents on file at the offices in this city. Conseiderehle of this news is later thsn thst procured from the interior journals:

The tnnnel at the Electric is going ahead night and dey.

Letter of the 4th from the Savage says: For the last 24 hours the pnmp lowered the water 2 feet; pump ran yesterday ou the morning shift 12 honrs at 6¼ strokes per minute, and on the night shift 11 hours at 7¼ strokes and 1 hour at 1 stroke.

A fine body of qnartz was struck the other dey in the east drift of the Ledy Washington, 180 feet from the shaft.

The Jnetice continues to ship 300 tons of ore per dsy to the mills.

The west drift of the Raymond & Ely mine is now in 1,852 feet, and in more favorahle gronnd. An assessment of $1 per share has been levied on this stock.

Operations at the Chollar for week ending December 2d are as follows: No. of tons of ore extrected, 587¼; No. of tons forwerded to mills, 654¾; average assay valne of ore mined, $30.50.

The water coming into the Hele & Noroross mine continnes strong; the pump hes done good execution the pest week, having lowered the weter in the incline 28 feet, and is now nine feet helow the 1900-foot level.

The hoisting works and mechinery for the Indien Queen mine hes arrived. The mill is still rnnning.

Letters of the 3d from Sevege says: For pest 48 honrs the pnmps gained on the water 10 feet, water now stands 321 feet helow the 1700-foot level, being a totel gain of 237 feet.

Telegrem of the 4th says: Pnmps running well, water 323 feet below 1700, and well below 1900 station.

The principal pert of the mechinery of the Comenche hes arrived at the mine.

Letter of the 2d from Empire (G. V.,) seys: The ledge in No. 5 north, No. 8 and 9 south is still very small, good milling ore, hnt very hard gronnd. No change whatever in 10 and 11 south, ledge a good size hut low grade ore. Everything is running aloug es usnal at mill and mine.

The lining of air compartment of the shaft of the Gould & Cnrry mine has greatly aided the ventilation of the mine. At points where the thermometer registered 102 degrees, it now ranges from 70 to 80 degrees.

The lest cleen-up of the Eareka (G. V.,) for five deys' run of 10 stamps, 12 honrs per dsy, is 255 onnces amalgem.

The Modoc (Inyo connty,) furnace is rnnniug steadily, and furnece No. 2 hes probahly heen started np by this time.

Eureka Consolideted letter of the 29th says thst the mein west drift from the 9th level is improviug, with good indications and every prospect of comiug npon a vein of ore. The ground is more fevorahle for working and progress more rapid. The connections hetween the 9th level drifts and the west winze from the 8th level will give hetter ventiletion throughout the 9th level. The engine pleced on 9th level is working well. Have commenced drifting from hottom of north winze, 100 feet helow the 9th level.

The Leoperd contiuues to yield the usual amonnt of ore.

Advices dated Nov. 28th from the Menhettan state that during the week, euding Setnrdey, 25th, the mill reduced 120¾ tons of ore, the assey velue of which is $25,145.73, which will prodnce in hnllion ahont $22,631.15. The mill wes delsyed several times during the week by breaking of the cem sheft, and hy necessary repairs in the pen room.

An applicetion hes heen mede to the San Francisco Stock and Exchange Board to allow the name of the Segregated Gold Hill miniug company to he chauged to the Golden Stete mining company.

H. H. Granice, who killed Edward Medden, has heeu convicted at Merced of mnrder in the second degree. It is thought that his counsel, Jndge Terry, will carry his case to the Snpreme Conrt.

Mining in Mendocino County.—Mr. A. O. Cerpenter, of Ukiah, writes us thet the ditch bringing water from the Green creek into the mines ahout Calpella is being prosecuted with vigor, 45 men now being engeged iu the work. An old resident of this neighborhood formerly honght $800 of dust, takeu from this gronnd with rockers, and avers thet the color mey he obtained from the dirt thet will cling to a hunch of grass pulled up almost enywhere on the gronnd segregated for working, which emounts to several hnndred acres. The gold is very fine scele, and muet he worked with csre to he remunerative. A new hotel aud meny dwellings have been hnilt at Celpella, on the strength of this discovery, or rether its systematic working. Lively times are looked for there, end here too, as the diggings are only six miles from Ukiah.

The misery in Belgrade is said to he terrible.

Mammoth Coal Vein Section.

The monumental column of enthracite coal in the center of the trophy recently exhibited in the government huilding at the exhibition, wes cut from the Mammoth vein at the Plauk Ridge colliery in Schnylkill connty, Penn., et a distance of ahout 160 feet helow the surfsce of the grouud. As pleced it shows the totel thickness of the vein and the alternations of coel and slate, which are given in detail in the accompanying teble anc section.

12° Bottom Slate.

The nonumental column of enthracite coal in the center of the trophy recently exhibited in the government huilding at the exhibition, wes cut from the Mammoth vein at the Plauk Ridge colliery in Schnylkill connty, Penn., et a distance of ahout 160 feet helow the surfsce of the grouud. As pleced it shows the totel thickness of the vein and the alternations of coel and slate, which are given in detail in the accompanying teble anc section.

It wss of course impossible to ohtsin such a section as this in a single piece. It wes therefore cut out with great care in benches, corresponding to the numhers given on the section, No. 1 being at the hottom. The column is ahout three feet sqnare, and has a total weight of shout 18¾ uet tons. Eech of the 19 blocks was securely cesed and two platform cars were reqnired to transport them from the miue to the exhibition.

The ennexed sectional diagram shows the memmoth vein end the three veins lying below it, the intermediate speces heing occupied hy conrse and fine sandstone shsles. The shaft of the colliery is indicated at *B* aud the point at which the coal was taken at *A*.

This interestiug column, says the *Engineering and Mining Journal*, is the contrihution of the Philsdelphia and Reeding coal end iron compeny, through Franklin B. Gowen, Esq., the Preeident of the company. Much credit is also due to Gen. H. Pleasants and Joseph Herris, the mining engineers of the company, eud to the Snperintendent of the colliery. As it was impossihle to sustein snch a high column without a rigid framework, application was mede to Semuel J. Reeves, Esq., the President of the Phœuix iron works, who supplied the heantiful iron pletform and tower which supported the coal. This tower is constrncted wholly of the Phœnix tubular column and the girders menufscture at that establishment. For greater security the coal is sustsined upon three separate floors, one ahove the other, so thet the weight of the entire colnmu does not rest upon the lower lnyers of the cosl.

The hese of the trophy is formed hy grouping large masses of merhle, iron, copper and zinc ores, nickle ore, phosphorite, etc., together with hales of cotton, sheeves of cereels, tohecco and other prodncts of the soil and miue.

The greatest credit is due to Prof. W. P. Bleke, who has charge of the collectious of the Smithsonian Institute et the exhibition, not only for secnring this fine representation of our anthrecite cosl heds, hut for the admirehle collection of economic minerels aud their products, which occnpy so worthily a large space in the United Sates Governmeut huilding. Throngh the indefatigehle efforts of Prof. Blake, guided hy his wide acqneintance with the mineral districts of the country and his knowledge of the requirements of such a collectiou, are we indehted for this creditahle illustration of the mineral wealth of the country. Had it not heen for the Smithsonian Institute, and for its fortunate selection of an executive officer, the minerels of the United States would heve hed hut a very indifferent representation.

SECTION SHOWING VEINS WORKED AT PLANK RIDGE COLLIERY (P. & R. C. & I. CO.)

Scale 600 feet per inch.

NOTE.—*A*, Point from which column of coal was taken; *B*, Plank Ridge Shaft.

It will he seen that hard, bright coal, of a snperior quality, alternetes with what is called hony coel end slate. The good coel, however, very largely predominates, being in the aggregate 40 feet 11 inches thick; while the hony coal is hnt one foot eight inches in all; and the slate, which, thongh often highly carhouized, is carefully separated from the coal hefore sending to market, is one foot five inches in thickness, meking the totel thickness of the vein, end consequently the hight of the column of coel, 44 feet.

Bullion Shipments.—Since our last issue shipments from prominent mines have been as follows: Ophir, Nov. 29th, $11,810.91; Manhettan, 28th, $12,300—total for the week, $24.200, for the month, $96,500; Leopard, 28th, $4.500; Modoc, 233 hars—totel to dete, $86,684; Northern Belle, 26th, $18,005.19; Chollar, 28th, $7,445.05; K. K. Con., 27th, $3,750—totel this month, 1st to 27th inclnsive, $50,000; California, 29th, $122,319.48—totel since dividend, $838,202.68; Northern Belle, Nov. 28th, $12,005.79; Comanche, Nov. 28th, $6,326.46. Northern Belle, 30th, $12,001.09; California, Dec. 2d, $83,324.03—totel since dividend, $921,526.71; Con. Virginia, 1st, $151,841.84—total since dividend, $683,239.72; the 2d, $47,291.98 — total since dividend, $730,531.70; Modoc, Nov. 30th, $6,040; K. K. Con., 28th, $3,750; 30th, $3,000—to dete for month, $56,750; Ophir, Dec. 2d, $36,368.04—total to date, $98,201.61; Tyho Con., Nov. 27th, $8,698.10—totel to date, $43,549.38. Chollar, Dec. 2d, eight hers, velued at $22,186; Modoc, 2d, 235 hers; totel for Dec., to dete, $12.100; Menhettan, Nov. 30th, $12,300; total for month, $96,500; Arizonn, Dec. 3d, $3,547.88; Leopard, Dec. 5th, $9,800; Northern Belle, 3d, $18,002.76; K. K. Con., 2d, $3,750.

Col. J. A. McDonald, Captain of the Scottish rifle team, which recently visited the United Stetes, has been appointed Solicitor-Geuerel of Scotland.

General Crook's expedition against the Indiana has left Fort Reno.

Concentrating Works.

The Colorado *Miner* has the following description of the new works of Matthews & Co.: As the development of our mines progresses the amonnt of low grade ore which may be profitably treated by concentration increases proportionatsly, and in the near fnture the business is destined to assume an importance which even its warmest advocates have not foreseen nor predicted. The concentrating mills now in running order at Georgetown, Silver Plnme and Brownville can handle 150 tons of ore daily, and it is safe to assume, will treat 100 tons in each working day of the year hereafter. The crnde ore of this character will average abont 25 oz., and the loss in handling will not exceed 20 per cent. At the lowest estimate, 2,000 onnces of silver daily, or nearly a million dollars per annum, will be added to the product of Clear Creek county, while these mills are in successful operation. As the value of our millingfore, outside of concentration, is now somewhat above two millions per annnm, and as the crude mineral carrying 25 to 40 oz. silver had had no market value whatever, the importance of this industry may be appreciated at a glance. Bearing the above facts in mind, Messrs. Mathews & Co., proprietors of the Rocky Mountain sampling mill, determined to add concentrating works to tbeir plant and have just completed an extensive mill, capahle of handling 20 tons daily, of which we shall give a brief description.

The mill building proper lies north of and adjacent to their sampling works, and is 60 feet in length, 33 feet wide, and 38 feet high, including the cupola. Advantage has been taken of the elevated road built for the sampling works, to receive ore on the upper floor and thus allow it to proceed through the various mechanical operations mainly by its own gravity. On the upper floor, where the crude ore is received, stands a Blake crusher, No. 2 size, of the latest patent, and below it a pair of 10-inch rolls, made by Fraser, Chalmers & Co., of Chicago, who have also constructed all the iron work and machinery employed in the mill in their usnal thorough and efficient style. After passing tbrough the crusher and rolls, a sample having been taken antomatically from the ore as it leaves the rolls, the ore is conducted by an elevator to the top of the tower, where it is dropped into a water sizsr and all dust drawn off in the form of slime. The ore passes thence into revolving screens, four in number, of 10, 20, 32, and 60 mesh wire, respectively. All coarse ore which is caught by the first is returned to a pair of finishing rolls, and sent back by the elevator. The slimes mentioned above are conducted to a settling tub, where they are deposited, and drawn off into a dolly tub over the Frue vanning machine to be used when required. The finest screen also discharges directly into the tank over the Frue machine, but the intermediate sizes from screens Nos. 1, 2, and 3 fall into the three jigs on the second floor. Tbese jigs are essentially the same as those employed by the Silver Plume Consolidated company, except that they have three instead of four compartments, and are five feet wide by nine and ten feet in length. A water sizer at the discharge of each separates any slime which has remained with the ore, and leads it into large settling tanks, whence it may be removed at pleasnre.

The tailings fall into square boxes below the jigs, and, after being tested, find their way into the creek, and the headings, or concentrated products, are removed from the jigs in the usual manner. Up to this point, the operations described have been snch as our mill-men have nsed for years, bnt for the treatment of the finest ore and slimes it is claimed by Messrs. Mathews & Co., and many others, that the Frue vanning machine excels in many respects any slime-table or other device ever practiced on Colorado ores. This machine needs to be seen to be understood. It is a large frame, 13 feet long and five feet wide, in which runs on rollers a heavy rubber helt, 27 feet long and four and one-half feet wide, turned up on the sides so as to prevent the ore and water from washing off. One end is abont six inches lower than the other, and the ore and water are fed from above, near the top and against the rise, in snch a manner as to be distributed evenly over the whole width of the belt. Tbe belt revolves toward the feed, moving about 110 inches per minute, with a lateral or horizontal motion of 180 strokes per minnte, and is arranged so as to be easily regulated to suit the character of ore under treatment. The two movements combined produce a result similar to the vanning or pan motion, making a complete and immediate separation of the rock and mineral. The rock is washed down the incline by the running water and swept off into a tailings-box. The mineral being of greater specific gravity clings to the belt, and is carried over into a tank at the head of the machine, where it is washed off by passing under the surface of the water. The fine mineral which is held in suspension by the water is caught by settling-boxes into which all the water used on the machine is conducted. The amount of water used is very small, not exceeding three gallons per minute. Perfect sizing and an even motion are required, but with these secured, the machine seems capable of giving better results than any now in use in Colorado.

Careful records will he kept of its workings, which we shall pnblish in a subsequent issne, but the practical tests which have been made go to demonstrate all that has been claimed for its economy and efficiency of concentrating fine material. Water for all uses in the mill is supplied from a never-failing well by a large Blake pump, which forces it into a tank seven feet high and six feet in diameter, on the upper floor. Tbis tank is heated by exhaust steam, and as the mill is protected by a double sheathing, filled in with sswdust, no trouble can result from the coldest weather. Two engines and boilers combined, of 40 horse-power, drive all the machinery of the concentrating and sampling works. The crushing floor will hold 100 tons of ore, and is connected by an elevator with an ore-house adjacent to the mill, which has a storsge capacity of 600 tons additional. The present crowded state of hins and ore-house shows that business has begun nnder favorable auspices. A drying-house, assay-office, and other buildings have been added, and the comfort and convenience of employees consulted in all essentials. Conrad Hanson, the well-known contractor, has constructed the buildings, built the wood-work, jigs, etc., and has done all his work in a thorough, skilful and conscientious manner worthy of his high reputation. Tbe credit of the inception of the works and their erection according to the latest and most approved plane, belongs almost entirely to D. Ernest Melliss, Ph. D., whose courage and enterprise have never faltered in the face of many discouragements. We congratulate the members of this firm on the completion of a mill which we believe will advance their own interests as materially as it will aid the mining indnstry of this district.

The Wheeler Expedition.

Now that the work of that portion of the Wheelsr expedition which has been operating in our immediate vicinity, says the Virginia *Enterprise*, is drawing to a close for the season, it will be of interest to our readers to know what has been done and what is proposed to be done next season.

The portion of the expedition known as party No. 3 of the California section, under Lieutenant T. W. Symons, of the Corps of Engineers, left the rendezvous camp at Carson, August 28th, and proceeding to the Carson river, just bolow Sutro, made camp and proceeded to the work of laying out a base line. A very oonvenient place was found on a straight portion of the old emigrant road through the valley, which is now very little traveled. Monuments covered with white cloth were bnilt at each end of the base and its development commenced by occupying and building monnments on tbe prominent snrrounding mountains. At these stations angles were very carefully taken to all the prominent peaks around the horizon, from whicb the work was taken up and carried on by the outlaying parties of the expedition.

At each of the stations occupied by these parties barometric, thermometric and psychrometric observations were taken to determine the altitudes. Angles were also very carefully taken to determine their position, and sketches made showing the general topography, leaving it for the meander parties to complete the details. At several stations azimuths of the various linea were taken and the whole connected for latitude and longitude with the astronomical monument on tbe divide between this city and Gold Hill. Among the stations occupied in the base development were Mounts Davidson, McClellan, Tibbie, Emma, Raw, and others.

After a sufficient number of points had been occupied the party separated, Dr. Kampf and Mr. Seckels, with three assistants, remaiuing at Sutro to measure the base, the apparatus for which has already been described in these columns. Lieutenant Symons with Mr. Anton Karl and Mr. Cameron came to Virginia and established a camp at Biddleman's ranch and commenced operations with the view of makiug an accurate contour map of all the country about Virginia, Gold Hill, Silver City, Empire, etc., in fact, of all the country embracing the mining and milling interests of the Comstock. Four plane table sheets have been filled in, two to a scale of 500 feet to one inch and two 1,000 feet to one inch. The general *modus operandi* is as follows:

The position of a sufficient number of points for each sheet was accurately determined by triangulation and computation by Lieutenant Symons, those points when laid off on the sheet forming the foundation for the detailed work done by Mr. Karl. At each station occnpied by the plane table and at many others, snch as raviues, canyons, road-crossings, etc., barometric observations were taken by Mr. Cameron, and lines were run with the level to get the data for contouring. On the 20th of October Dr. Kampf bad finished measuring the base and the party at Sutro had broken up. Dr. Kampf, after determining the azimuth of his lines at the astronomical monument on the divide, went to Washington to work up his results in the office of the survey in that city.

The plane-table work has been frequently tested and checked by the occupation of points with the transit and by cross-sights, and the idea and aim throughout has been to attain the greatest accuracy possible. Every mountain and hill will be shown in its proper shape, and every road, flume, canyon, ravine, reservoir, mine, mill, etc., be located with the utmost care.

The party will soon leave for Carson, there to disband and retnrn to Washington for its winter work. It will require nearly all summer to complete the field work laid out by Lieutenant Wheeler for the party, and then a map will be constructed which will be a delight to the eyes of every resident of Storey county, and every citizen of the United States interested in the Comstock. It will be of immense valne and of unquestionable accuracy.

Of the importance of such a work to us here on the Comstock it is scarcely necessary for anything to be said. The time has come when an inch of some of our mines is a small fortnne yielding a liberal income per month. Many of the outside localities are rapidly increasing in importance, and how soon tracts now comparatively worthless may be of immense value cannot be told. Disputes over land and mining claims have been fruitful of bloody contentions in the past, and are so to-day in too many instances. If such things are ever to cease, it will be when the means is at hand for determining unmistakably and to an inch the exact rights of respective land and mine claimants. The necessary data will be furnished for this by this survey, and from the work done by this party on and along the Comstock. This, outside of the great and important general work done, should be sufficient reason for continuing the survey.

But all this depends on the action of congress at the approaching session. If the necessary appropriations are made the work will be pushed forward to an early completion. If, however, the spirit of a mistaken economy is allowed to prevail to such an extent as to stop all such necessary work, it will have to be laid aside. It is sincerely to be hoped that this desirable, this necessary work may be allowed to go on to an early completion, and to this end we ask all the friends of Nevada and Washington to stand by our representative in congress and aid in securing the requisite appropriations that this work, so necessary for us here on the Comstock, may be continued.

The expedition here has been characterized by the most rigid economy and a total absence of all sinecures. The employees have shown a sincere devotion to the work and a determination to attain perfect accuracy as a result. These have been the leading characteristics of the exploring expedition under Lieutenant George M. Wheeler, and certainly if any government work deserves support and to be continued it is that under this young officer, who has already attained a reputation which has crossed the ocean and of whom the United States ought surely to be proud.

Oregon Silver Mines.

The reported richness of the Camp Creek silver mines has created so much excitement and aroused the curiosity of the people to such an extent, consequent on the contesting parties who are contending for the property, that a little history of the discovery may be of general interest. The mines are situated on Camp creek, a tributary of Crooked river, in Wasco county, distant about 300 miles from Albany and 190 from The Dalles, surrounded by elegant ranches and in the midst of the most luxuriant grazing country in the world, where bnnch grass abounds and stock revels in the richest pastnres. Some four weeks ago Messrs. White, Ross and a negro, all of East Portland, were on a cattle hunting expedition in the country just named, when their attention was attracted by tbe appearance of a number of boiling springs. They remained for some time examining them, and remarked upon the soapy substance that exuded from their summits. Finally Ross picked up a piece of quartz, and remarked that it bore a striking resemblance to the argentiferous rock in the White Pine district. They agreed to bring some with them to Portland and have it assayed.

On their return they related their adventure to a Mr. McCann, and he, as a matter of course, told others. The assay was richer than their wildest dreams had imagined and increased the excitement already existing. The original discoverers started on their return to the mines to pre-empt their claims, but the party to whom McCann recounted the discovery determined to reach the goal ahead, if possible, as "possession was nine points of the law." They took the Albany train, and, on their arrival, hired the fastest horses they could find, changing them when tired ont for fresh animals. As may be imagined horse flesh wasn't regarded worth much when contrasted with the end in view. Suffice it to say they arrived in advance, located and recorded their claims and felt well pleased at the success of their trip. In the course of time White, Ross and his friends reached the scene, and by virtue of their right as discoverers drove off the McCann party by threats and the free display of arms. They then organized a mining precinct, elected Mr. Cunningham, of East Portland, recorder, staked off and recorded 1,500 feet of the lead on which are situated five of these boiling springs, and are determined to hold it at any and every cost. As there are two sides to every story, it is but justice to give the other. The McCann claimants say that the discoverers had no idea of the valne of the springs and the knowledge of the matter contained therein, and it was elucidated in this wise: The negro seeing the soapy appearance of tbis substance issuing from the springs wished to test it as a laver. He washed his handkerchief with it and the result answered his expectation. He filled some yeast powder cans with the material and on his arrival at the Dalles had one of them stolen. The parties taking it mixed it with borax as a slag and subjected it to intense heat, which produced small globules of the purest silver. The discovery caused the rush, excitement and contortion which have since taken place.

The vicinity is evidently rich, but thns far no well-defined ledge has been struck. The hill is covered over with argentiferous black qnartz mixed with sulphates and chlorides of silver, imparting indications of the greatest richness. The lode is in the range on which is situated the one that was bonded to Mr. Samuel Parrish, and the rock partakes of the same character. The region of the discovery is one of the most favorable that could be found, as it affords every facility for the cheap working of the mine. Mr. Ross and Sorr and the negro left this morning for their claim, prepared to defend tbeir interests, should snch a course be necessary. The probabilities for a war are very favorable, as both parties are large, well armed and equally determined to maintain possession. We shonld not be snrprised at any time to hear of blood being shed. We would counsel a peaceful compromise and amicable adjustment of the unpleasant affair, if at all possible, before either party proceeds to extremities.—*Portland Standard.*

On Graft Hybrids.

The following paper by Thos. Meehan, Germantown, was read before the American association for the advancement of science, at Buffalo, August, 1876: Of late years an impression has prevailed that hybrids may be obtained by grafting as well as by seeds. Sachs makes no mention of this in his text book, but it has had place in the literature of horticulture for over a hundred years. Bradley says that a variegated jasmine grafted on a common-green stock infused the variegation through the whole plant; and there is an idea among some horticulturists that an intermixture in apples can be obtained by uniting two halves of different buds and grafting them together. Thousands of people have laughed at these notions. No one has tried them. But only a few years ago it was found that Bradley was right; and we have in cultivation new variegated forms of *abutilon*, as well as some other things originated by the graft process.

During the past few years it has been asserted that new varieties of potatoes have originated in this way: a tuber is taken and all the eyes cut out. A wedge with an eye of another kind is then inserted into the eyeless mass and planted. The results are said to be true hybrids. Many of our best physiologists doubt this. I have not seen these cases; bnt I must say the evidence offered is much stronger than much of that on which some popular theories have been built. I tried the split and grafting process, not believing it would result in a hybridity. I merely wished to test the popular notion. I am pleased to be able to say now that it is correct. New varieties can be obtained in that way. I took the Rhode Island Greening and the Red Astrachan—two very distinct varieties of apples in every respect. The grafts with a single bnd were split as near through the center as possible, and a piece of each kind fitted together so as to appear one complete scion. Twelve of these were grafted; three grew; two of these have fruited; neither are Rbode Island Greening, and the two are unlike each other; one of these has a flower like the Rhode Island Greening, and the flower of the Red Astrachan is rosy and in many ways distinct from the large white one of the Rbode Island Greening; but the fruit is, in many respects, similar to that of the Red Astrachan.

The second variety has the flower similar to that of the Rnode Island Greening, and the fruit somewhat the color of the Red Astrachan, ripening about the same time, but is but half the size, very much flattened, and with a slender stem near two inches long, and as much like that of a Siberian Crab as can be. There is no doubt but two varieties, distinct from their parents, and distinct from each other, have resulted from this graft process. Some may suppose that the union of a Red Astrachan and a Rhode Island Greening apple should result in producing an exact intermediate, and that the union of buds in several graft cases should each produce identically the same, and therefore the two distinct varieties from the same process be a surprise. But no two children of the same parents are exactly the same; and this is the experience of plant hybridists. Our fellow-member, Mr. W. Saunders, of London, Ontario, crossed the American gooseberry (*Ribes Cynobasti*) with the Red Warrington, an English variety, but both with hairy fruit. The hybrid product has smooth fruit, thus introducing a character not extant in either parent. And as regards variety, I have myself, from one single berry of a fertilized fuchsia, produced several score of plants, among which no two were alike. I do not know that there is any pomological value in the new varieties of apples I have raised, but I am delighted with the scientific results, proving that hybrida by bud-grafting is more than a popnlar delusion.

Steel Iron.—A German firm—Asbeck, Osthaus & Co., is manufacturing a substance they term steel iron, in five different varieties, so they can furnish steel upon iron, iron between two layers of steel, steel between two layers of iron, steel core and iron skin, or iron core and steel skin. It is made in an iron shell, divided into two compartments by an iron plate. Before melting, both the steel and malleable iron are cleansed from any substance which would impede their welding. In the casting, they are run at the same moment into the shell, in such a manner that the separating diapbragm serves to weld the two metals together, which form an inseparable mass when cooled. The process is recommended for rails, anvils, armor plates, etc. The process is said to have been known some time since in France,

Scientific Progress.

The Missing Link.

M. Herman Fol, a Swiss naturalist, has recently contributed a memoir to the Geneva society of physics and natural history on the *Appendiculaires*, a family belonging to the class of animals known as *Tuniciers*. In this article he confirms the near relations that several authors have established between these animals and the vertebrates, and proposes them as the trunk from which the latter were developed. On this point the editor will, perhaps, be pardoned a few necessary observations. It seems evident at a glance, whatever may be our views on incidental questions, that the spinal column that distinguishes vertebrates could only have originated in aquatic habits. In fishes, for instance, it serves the function of an axis of motion extending from the head to the tail, the central canal being occupied by a tissue having the function of conjunctivity, and the muscles being arranged in such a manner as to act from a central osseous axis. Of the various types of motion observed in aquatic animals, the vertebrate appears to be that most conducive to rapidity of movement combined with flexibility as respects direction. Accordingly, in land animals, so long as the perfect integrity of the spinal column continues, as in reptilians, the type of motion continues to be substantially the same as in fishes; and, in the course of their fœtal development, all vertebrates pass through a spinal type that has its homologue in fishes. That this is an original type of motion, and one not fairly derivable from another or lower type, seems evident from the fact that no satisfactory link can be found to connect it with other forms. The extinct ornithic reptiles furnish a clear link between birds and reptilians. So, again, the mammalian type of motion can be readily traced to the aquatic type presented in fishes. Our conclusion, therefore, I think, in the present state of the facts, must be that the vertebrate type of motion had its origin with aquatic animals as a simple and primitive type, springing directly from the primordial necessity in such animals for a type of motion dependent on, and involving the development of, such a longitudinal axis as that which is exhibited in fishes in its simplest and most perfect form.

Crystal Finding.—The use of rock crystal in the manufacture of optical instruments has led to the development of the curious and interesting profession of crystal finding. It is, however, an old occupation in the Swiss Alps, where not only the knowledge of the crystal finder, but his nerve and endurance, are often put to a severe test. The rock crystal—pure silica, or crystallized quartz—is found in pieces of different size, color and fineness, sometimes separately, sometimes in groups. The strahler—as the crystal finder is called—is equipped with a bar of iron four feet long, bent up at one end, a shovel, a hammer, a hack, a strong cord and a leather sack, and starts for his work early in the morning. He is nearly always alone, as the Swiss are not fond of "going shares" in any piece of good fortune. He crawls along the flanks of the hills bours together, along the most perilous paths, looking out anxiously for any indication of a vein. This may be a long way above him, and he tries to reach it as best he can, being not infrequently compelled to cut his steps in the rock. His first act, on reaching his find, is to strike it with his hammer, his ear telling him whether the crystals are attached to the walls, separate or mixed with sand. The most celebrated find of large crystals is the recent one made at St. Gothard. A hundred feet above the snow limit, an apothecary, a resident of Berne, saw, one evening, a vein of quartz, 60 feet long, and four to 12 feet thick. A guide was with him, and the two resolved to ascend for an investigation. This, however, had to be deferred till the morning. The would-be finders passed the night in a hut, and rose early to make the ascent. Unfortunately, the morning was misty, and threatened to cut off their retreat. They descended in haste, and were unable to renew their attempt until the following year, when the spring had melted the winter snows. The day at length arrived when they were able to begin work, and, by mining the vein, they pierced into its inner chambers, and collected 300 cwt. of crystals, the largest of which were bought up by scientific institutions, and the fragments by opticians and instrument makers.

The Microscopical Study of the Brain.—Dr. Walter H. Kempster, physician and superintendent of Northern hospital for insane, Oshkosh, Wis., briefly outlines the progress made by recent investigators in studying the pathological histology of the brain in insanity, as follows: 1. The importance of microscopic observations of the several cerebral membranes, to determine their pathological condition, and the relations that the various pathological states hold to the forms of mental aberration. 2. The abnormalities in arterioles and capillaries, including the various deposits on the walls of the vessels; engorgement and its consequences; the several changes observed in the coats of the vessels; occlusion from minute thrombi, and embolism; alterations in the course of the vessels, and the effects these conditions have upon the surrounding brain tissue. 3. Miliary aneurisms and miliary hemorrhages: the effect they have in the production of brain disease. 4. The peri-vascular sheath, and peri-vascular canal, as they are found in cases of insanity, were considered in their relations to adjacent brain tissue. 5. The various alterations in structure and form noted in nerve cells and nerve fibers, in the several forms of insanity. 6. The abnormalities in the cerebral gia, and the conditions called "miliary sclerosis," and "colloid degenerations," were described, and the influence each condition has in impairing normal cerebral action was discussed. 7. The various pathological conditions found in the microscopic examination of the brain in a number of cases of insanity, were illustrated by means of photo-micrographs, made from fresh and prepared specimens. The pathological states observed were considered with reference to the mental symptoms noticed during the course of the various forms of insanity.—*Virginia Medical Monthly.*

A New Route from Europe to China.

Should further explorations of the route from Europe to China via the Arctic ocean and the Yenesei river, across Siberia, as laid down by Professor Nordenskjold, of Sweden, prove its entire practicability, a great stride will have been made both in commercial and in geographical science. The distance from England to Volgino, at the mouth of the Yenesei river, is about 3,000 miles, and from Volgino to Peking, in a direct line, about 3,000 more. The present route from England to Peking, via the Mediterranean sea and Suez canal, is about 12,000 miles. The Yenesei river has its source in the Altai mountains, which form the boundary between China and Russian Siberia. It flows almost due north into the sea of Kara, which is distinguished from the waters of the Arctic ocean merely by the islands of Nova Zembla and the capes of the main land, which appear to partially inclose it. The distance between the headwaters of the Yenesei and the sources of the Amoor river, which flows into the gulf of Tartary and the Japan sea, is about 150 miles. The navigation of these rivers would have to be done by light draft steamers, while the short overland route of 150 miles might soon be "all rail" and resonant with fast trains. As the route lies through Russian territory that country, of course, is master of the situation. At present a large proportion of the Russian and China tea trade is carried on overland by caravans, which the new route, if developed as suggested, would render obsolete. In a political point of view, the proposed route is of much importance in its bearing upon the Russian and English possessions in the distant East, and may introduce new sources of trouble between those powerful rivals.

The Eye of Man in the Past.—Science gives us interesting details about what the human eye has been and what it may become. The Vedas of India, which are the most ancient written documents, attest that in times the most remote, but still recorded in history, only two colors were known, black and red. A very long time elapsed before the eye arrived at the perception of the color yellow, and a still longer time before green was distinguished; and it is remarkable that in the most ancient languages the terms which designated yellow insensibly passed to the signification of green. The Greeks had, according to the received opinion now, the perception of colors very well developed; and yet authors of a more recent date assure us that in the time of Alexander, Greek painters had for fundamental colors only white, black, red and yellow. The words to designate blue and violet are wanting to the Greeks in the most ancient times of their history, they called these colors gray and black. It is thus that the colors of the rainbow were only distinguished gradually, and the great Aristotle only knew four of them. It is a well known fact that when the colors of the prism are photographed, there remains outside the limit of the blue and violet in the spectrum a distinct impression, which our eyes do not recognize as a color. According to physiologists, a time will come when the human eye will be perfected, so as to discern this color as well as the others.

Industrial Application of the Sun's Rays. M. A. Mouchot presents to the French academy a small "solar alembic" easy to set up and to remove. The mirror is 50 c. m. in diameter; the boiler contains one liter of wine, which is brought to a boil by half an hour's exposure to the sun. The vapor of alcohol enters a tube placed in the center of the boiler, traverses the foot of the mirror, and descends into the worm, where it condenses. The foot of the mirror is a gas-tap fitted with a groove and a set-screw, which permit the boiler to be always turned to the sun. If the boiler is filled with water, and if a receptacle full of leaves or odoriferous flowers is interposed between it and the worm, all the essences procurable by distillation may be obtained.—*Chemical News.*

Association of Racial Types.—Herbert Spencer, in *Popular Science Monthly*, says upon this subject, that "throughout the animal kingdom the union of varieties that have become widely divergent is physically injurious; while the union of slightly divergent varieties is physically beneficial. Some facts seem to show that mixture of human races extremely unlike produces a worthless type of mind. Natures respectively adapted to slightly unlike sets of social conditions may be expected, by their union, to produce a nature somewhat more plastic than either. The best genius of England resulted from a union of Celts and Anglo-Saxons."

Mechanical Progress.

New Nomenclature of Iron and Steel.

The following is the report of the international committee appointed by the American institute of mining engineers on the nomenclature of iron and steel:

Whereas: The recent production of soft, cast, malleable compounds of iron by the Bessemer, the Siemens-Martin, and the crucible steel processes appears to demand a new nomenclature of iron compounds, for the following reasons:

1st. The term "steel," by which these soft products are commercially and professionally designated in England and in the United States, does not completely distinguish them from previously existing "steel" which would harden and temper.

2d. A nomenclature recognized in all languages seems desirable, as well for commercial as for scientific purposes, especially as lawsuits, already commenced, depend on the meaning of the term "steel."

3d. Although homogeneity, due to fusion, is usually recognized and is by this committee recognized as the most definite characteristic of both hard and soft steel, this quality may be equally well expressed in other terms, thus leaving the old term "steel," to define the malleable compounds of iron which will harden and temper:

Therefore resolved, That this committee recommends the following nomenclature:

I. That all malleable compounds of iron with its ordinary ingredients, which are aggregated from pasty masses, or from piles, or from any forms of iron not in a fluid state, and which will not sensibly harden and temper, and which generally resemble what is called "wrought iron," shall be called "weld iron" (German, *schweisseisen*; French, *fer soude*).

II. That such compounds when they will from any cause harden and temper, and which resemble what is now called "puddled steel," shall be called "weld steel" (German, *schweiss-stahl*; French, *acier soude*).

III. That all compounds of iron with its ordinary ingredients, which have been cast from a fluid state into malleable masses, and which will not sensibly harden by being quenched in water, while at a red heat, shall be called "ingot iron" (German, *flusseisen*; French, *fer fondu*).

IV. That all such compounds, when they will from any cause so harden, shall be called "ingot steel" (German, *fluss-stahl*; French, *acier fondu*).

Signed, I. Lowthian Bell, P. Tunner, A. L. Holley, Dr Hermann Wedding, Richard Ackerman, Thomas Egleston, L. Gruner.

New Glass Machinery.—The *Iron Age* says: Messrs. Thomas Wightman & Co. have now in successful operation a new glass melting furnace at their works on the South Side, Pittsburg, which has many advantages over the furnace now in general use, and which promises to exercise a healthy influence in giving an impetus to that branch of Pittsburg industry. It was invented and patented by Mr. Evan Jones, and the principal improvement is in the construction of the pots, which are much wider and shallower than those now in general use, being made in such proportion that they require but one filling to make a melt, in place of the three fillings of the old plan, saving much time and fuel. The construction of the furnace is such that the blower can make 90 cylinders to the melt, against 60 from the old furnace, and there only being a reduction of the depth of glass in the pot of about nine inches in making 90 cylinders, it is much easier gathered. The furnace is worked without the assistance of a blowing furnace. On the old plan but from five to six melts could be made per week, making, say, 360 cylinders. The new furnace works at the rate of from 10 to 12 melts per week, or, say, 1,080 cylinders, thus doing three times the amount of work and (on account of the shape of the pots and furnace) with an actual saving of two or three hundred bushels of coal. The shallowness of the pots are much in their favor in resisting the pressure of the melted glass. The furnace has been in operation for a week and is giving perfect satisfaction.

A Canal Steamer.—A steam tug invented by Hugh Stevenson, of Oshkosh, Wisconsin, is exciting attention among those interested in canal navigation. The boat is 55 feet long, 16 feet beam and 4½ feet deep. Attached to the main shaft, in the center of the boat, are 2 large shafts, 14 feet long, incased in beams 15 inches in diameter, which shafts connect with shafts which turn driving wheels. These driving wheels, 2 feet 4 inches in diameter, double flanged and very heavy, run on an iron rail laid along the bank, and propel the boat by traction. A half mile of track has been laid where the trials are being made, and the tests thus far have been very successful. The invention, it is claimed, does away with all wash in the canal. A tug will cost from $3,000 to $3,500.

Bituminous Macadamization in Paris.—In the Faubourg Poissonnière an experiment new to Paris is being tried in road making. The road is being laid with broken stones and pebbles, and the whole held together with asphalt or bitumen. The asphalt is allowed to cool, and the material is subjected to a powerful pressure from a steam roller.

Scotch Street Locomotive.

English papers give the following report of a recent experiment in Edinburgh: The first trial of steam as a motive power was made on the Portobello line of the Edinburgh street tramway company a few days ago in presence of the chairman and directors of the company. The engine, which was manufactured by Hughes & Co., of Loughborough, is the same in general character as that now used, with permission of the local authorities, on the tramways in Leicester, but has been constructed specially for the Edinburgh company. Messrs. Hughes & Co.'s tramway locomotive is, in form, a small tank engine enclosed in a car, and thus presenting nothing to the outward appearance to suggest those objections to which steam tramway cars have been exposed, and in no place more than Edinburgh. The "blast," which has been the stumbling block in the way of the urban use of road steamers, is entirely removed, while the nature of the fuel used and the arrangements for condensation remove all visible discharge of smoke or steam. The engine is constructed to condense its own steam for a run of at least six miles, and the water thus used is available either to throw on the roadway as the engine proceeds, or to be discharged at the end of the journey. Coming to the actual result of the experiment at Edinburgh, we are informed that the directors and those gentlemen whom they had invited to witness the first running of the engine were satisfied in every way as regards the success of the engine in overcoming the usual objections to the use of steam. In the course of the journey over a public road, on which a considerable amount of traffic was going, the horses which met the car or were overtaken by it, treated it with the utmost indifference. Being market day there were many carts on the road, and a considerable number of riding horses were out for a morning canter. A pair of spirited grays with a wagonette, the property of the chairman of the company, also accompanied the car the whole of the journey, and the perfect calmness with which every horse regarded the novel machine proved that the most formidable objection to the road steamer—the blast, or discharge of steam—had been effectually overcome. The absolute control under which the car is driven, both as regards variation of speed and sudden stoppage, also attracted attention; while the circumstance that the driver is in front, full in view of every occurrence in the street before him, seemed to make the machine in some respects more safe and manageable than a car where the driver has his team of horses between him and any obstruction he may meet. This consideration and the excellent guard or "cow catcher" with which the machine is fitted, remove in a great measure the fears as to the safety of a steam car in the midst of other traffic.

A New Water Raiser.

M. Th. Foucault has invented a new apparatus for raising water by means of ammoniacal gas. The machine depends for its operation on the facts that water at 15 deg. C. absorbs 743 times its volume of ammoniacal gas, and gives it off again at 60 deg. C; that, at 100 C., the tension of the vapor is seven and one-half atmospheres; that petroleum and ammoniacal gas are without action upon each other; and that the same is true of petroleum and water. The apparatus consists substantially of a heater which is partially filled with a strong aqueous solution of ammoniacal gas. This heater is connected by pipe with the upper part of a closed reservoir, the lower part of the reservoir being connected by means of pipe and suitable valves with the stream or well from which and the tank to which water is to be raised. The reservoir contains a small quantity of petroleum, which forms a thin stratum on the surface of the water, and serves to keep the ammoniacal gas from contact with it, and, as the inventor expresses it, forms a fluid piston. The operation is as follows: Supposing the reservoir full of water, the temperature of the heater is raised by suitable means; ammoniacal gas is given off, and passes over into the upper part of the reservoir, the stratum of petroleum preventing its being absorbed by the water there. A pressure is thus created in the reservoir, which forces the water there out and up to the tank to be filled. When all the water has been forced out of the reservoir, the heater is cooled by removing the fire and allowing a jet of water from the tank to play on it. The water in the heater, as it cools, reabsorbs the ammoniacal gas from the reservoir, and thus creates a vacuum, which the water from the stream or well rushes up to fill, and thus refills the reservoir. The heater is then again heated, and so on, as before. The inventor claims that the consumption of fuel is almost insignificant as compared with that of a steam-pump of the same capacity. The author also describes a modification of his apparatus adapted to be run by the heat of the sun, in which case the only expense is that of wear and tear, which is small, there being no moving parts.

Paper Church.—The Philadelphia *Ledger* says: There is a paper church near Berlin which can contain nearly 1,000 persons. It is circular within, octagonal without. The reliefs outside and statues within, the roof, ceiling, the Corinthian capitals, are all papier mache, rendered water-proof by saturating in vitriol, lime water, whey and white of eggs.

Mining Share Market.

The market for mining shares has for a long time been in a most unsatisfsctory condition. After a series of breaks, whicb almost amounted to panics, a revival set in a fortnigbt ago whicb promised a return to better times. The reaction, however, was short lived, and qnotations dropped to very nearly the lowest rates of the year. The general market, at the present time, is cbaracterized by an unwonted nndertone of strength. Prices have not yet rescbed the averSge Standard, but there is no pressure to sell and a growing disposition to invest, on tbe part of permanent holders, whicb imparts a feeling of solidity long unknown. In one respect the market of the past week has been a good one—the renewed activity has added to brokers' acconnts, and the rapid and marked fluctuations bave bronght out an unnsnal amount of business. Altogether, it msy be fairly said tbst the msrket is gathering new strength, and that the prospects for a better fntnre are actnally better now than has been the case for months, altbongh qnotations are still very low. The weaker accounts have been thoronghly clesned ont, and the element of uncertainty as to the immediate course slone remains to deter boyers.

The featnre of the week has been the deal in Overman, which hy its fantastic gyrations has become the center of attraction for tbe stock dealers who desire a lively security to operate in. From $78 it rose atesdily to $125, between boards; tben receded to $104; then fonnd a level at $116; subsequently drooped again, and bas at last almost recovered its prestige by a solid improvement. Caledonia, the neighboring mine, has almost eqnally attracted speculators, and its fluctuations, on a smaller scale, rival tboae of its bigger neigbbor. The news from these mines is somewhat indefinite, and the general impression is tbat the rise is rather the result of the perfect control held over botb stocks rather tban the uncovering of a second Gold Hill bouanza.

The annnal election of tbe Mexican mining company aronsed a certain amonnt of euthnsiasm. The contending parties were those represented by Senator Sharon and L. P. Drexell, of Virginia City. The vote was moderately olose, but the Sbaron party retsined their power and tbe old trustees were re-elected.

Lady Brysn is sgain a bone of contentiou; the dissatisfied stockholders are moving to secure their rights, and the whole affair promises to give rise to endless litigation.

The stockholdera of the Boston gold mining company are also causing a commotion in tbe affairs of tbat corporatiou, and call for a meeting to onst the present direotors.

Mausfield is agsin added to the list of the "dissatisfied." The stockholders in this company desire to examine the books and to mske certain changes in the administration, and expect to fix a charge of mismanagement npon the trnstees. Altogetber, tbe overhanling of acconnts is becoming general, and will donbtless lead to an improvement in the future.

The olosiug rates, as we go to press, indicate a fair advance in the market. No startling chsnges are promised, bnt the volnme of trsnsactions is sufficient to indicate a timely interest in the welfare of stocks.

The two bonsnza mines pay their nsual large dividends.

THE British troop-ship *St. Laurence*, with soldiers for Cspe Town, was totally wrecked off the coast of Africa. Tbe troops are all safe. A large qnantity of military stores were lost.

CAPT. A. H. BOGARDUS, tbe champion wing shot of the world, has arrived in this city.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE.

Exchequer Mill.—Alpine *Chronicle*, Dec. 2: The improvements at this mill are making better progress since the steam connection was made with the sawmill, which can now furnish all the lumber needed. When completed agreeably with the plans of Manager Chalmers, the Exchequer and its appurtenances will be one of the best reduction works of its capacity on this coast. The old roof of the main building has been removed and a new one raised which covers a greater area and gives the works a more imposing appearance. The front has been built out flush with the main road and will be finished in rustic. The foundation for a new boarding house to be erected a short distance south of the present one is nearly ready for the contractors to commence the erection of the building, which is to be large and commodious. A large stable to accommodate 25 or more horses is to be erected just south of the new blacksmith shop. The road will be turned and carried to the rear of the present stable and above the blacksmith shop. The sawmill is now quite complete in its appointments, running a Huntington shingle machine, and a planing, tongue and grooving and molding machine. There are very few if any companies having greater facilities for carrying on mining operations. The Exchequer company have a large timber tract, and all the timber required for mining and building purposes is turned out at their own mill, the teams carrying timber to the mine and returning with ore.

New Company.—The Washington gold and silver mining company of Alpine county has been formed here, and next week the certificates of incorporation will be filed in the offices of the County Clerk and Secretary of State. Its capital stock is $10,000,000 in 100,000 shares of $100 each. The first directors are Joseph McCloy, N. D. Arnot, Jr., Erich Prahm, James Somerville, John Fearon and David Dewar, of Silver Mountain, and David Perry, of San Francisco. Its principal place of business is at Silver Mountain. This company has been organized for general mining purposes, but more particularly to work the old Washington claim on the Mountain lode. This is one of the most promising mines in the Silver Mountain district, and we are pleased to notice a movement toward its development.

AMADOR.

Olive Mine.—Amador *Ledger*, Dec. 2: This is a newly located mine at Drytown, which bids fair to vie with any claim now being operated in that rising district. It is owned by C. Nickerson, E. M. Corliss and half a dozen other gentlemen of Sutter Creek. The shaft is close to the main road. There are two ledges running toward the road in the shape of an acute angle. At present the ledge is six feet wide, all full of gold. A piece of gold no larger than one's two fists was pounded, and yielded $7 in gold. Specimens of a similar character have been repeatedly met with in sinking. There are now some 50 tons of high grade ore ready for shipment. The owners of the Bonanza mill have agreed to crush 250 tons of the rock, commencing about the 1st of January. A contract has just been let to sink 60 feet. The surface indications are not of a very marked character, the outcroppings being traceable only a short distance.

Oneida.—The mill of the Oneida mine started up again on Saturday morning, with 60 stamps, after a period of idleness extending over two months. During this time the shaft has been thoroughly repaired, and the mine is now in better working shape than it has been for a long time.

Amador City is entitled to the palm for activity in mining at the present time. The entire vicinity along the line of the main lead is a perfect network of mines, all of them being vigorously prosecuted. The Keystone moves on its way grandly, the king among its fellows, turning out bullion to the value of between $30,000 and $40,000 monthly. The Original Amador has improved wonderfully of late, and can now be classed among the dividend paying mines of the county. The Gover continues to prosper, yielding a satisfactory amount of bullion at every clean-up. The North Gover is also in active working, with every indication of proving a paying investment. The Talisman we notice as among the richest claims in the wonderful mining region around Amador. Altogether Amador City is the liveliest mining town in the county, if not in the State. Amador is steadily enlarging, and promises to be a much larger town one year hence than it is to-day.

Spanish.—It is gratifying to be able to state that mining operations are about to be commenced between Jackson and the Mokelumne river on a scale that promises substantial results. Captain Beck, in the interest of Eastern capitalists, has purchased the Spanish mine, situated one mile this side of the river. It is well known that the rock in this mine is exceedingly rich, and it is there in almost inexhaustible quantities. The original owners, Messrs. Mizner and Follander, have taken out large sums of money, crushing the rock in arastras. The deepest shaft is down about 70 feet, and the flow of water became too troublesome for them to handle. Pieces of ore taken from different parts of the property show free gold. The auriferous vein, we are informed, runs from 10 to 20 feet wide, and is traceable about 1,600 feet. Captain Beck has had large experience in mining on the other side of the mountains, but he says this is the most flattering prospect he has ever seen, and expects to develop a mine that will add materially to the prosperity of Jackson and the neighborhood. Two contracts have been let to sink 100 feet in two shafts. Negotiations are also pending to put up a 20-stamp mill to be in running order in six weeks or two months. There is plenty of ore in sight to keep such a mill running for five years. The whole undertaking is evidently in the right hands, and it is not too much to look for one of the richest permanent mines in successful working in Spanish gulch in the course of a few months.

BUTTE.

Mining.—Oroville *Mercury*, Dec. 1: Under this caption we referred to a number of mines in Butte county last week, but not to all of them. Among those that escaped our attention was the Bangor Blue Lead hydraulic mining company, of Wyandotte township. This company has some 300 acres of the best mining land in Butte county. Every part of it has been prospected by sinking shafts, and it contains gold in paying quantities from the top to the bedrock. The Blue lead has long been mined, but not within the boundary lines of this company, except in several places where shafts have been sunk, and in every instance with the very best success. The cement is hard and without a great amount of water it will be useless to spend much time here. The company, however, are wide awake to the value of their possession and have gone to work to procure water. In order to get a full supply they have had to go to Fall river for their head dam, a distance of 34 miles. Of course it will take time and money to do this, but both are to be had in abundance if we can credit the reports that come to our ears. Let the water once be brought in the mine and it will take the lead of mining operations in this county. The Severance claim in Bidwell township is paying well for the amount of work done upon it. For some unaccountable reason we are prohibited from giving the result of the clean-up at this mine. Just across the river and adjoining the Powers claim are 1,200 acres of the very best mining land in the State, owned by W. H. Parks & Bro. of Marysville, and F. A. Shaeffar, of Gridley's. Several parties have had their eyes open to this large claim in the hope that some day they might become the owner of a part of it, but it is not easy to get one of the owners to part with anything for less than its true cash value.

CALAVERAS.

Veith's Hydraulic.—Calaveras *Chronicle*, Dec. 2: Operations are being energetically pushed in Veith's Excelsior hydraulic, on Tunnel ridge. In the upper or northern portion of the claim a big blast is being put in, while in the lower claim piping goes steadily on. Mr. Veith contemplates putting up a water power derrick, in place of the hand machine at present in use, as soon as practicable.

Upper Country Mining Mites.—A lot of ore, said to be the richest ever taken from the mine, from the Champion, at West Point, is now being crushed in Carlton's mill. There is about 70 tons in the lot. Look out for another monster clean-up. Something like 65 tons of rock from the Mina Rica has lately been crushed in the mill connected with the mine. We have not been able to learn how much the rock paid, but the lowest estimate put upon it was $70 per ton, while quality as good judges set it as high as $135. The Mina Rica is looking splendidly. Very encouraging developments are being made in the Josephine. A rumor is in circulation that the Lone Star mine, at West Point, has been sold to a San Francisco company. We cannot vouch for the truth of the statement.

Rich Developments.—We have been shown some specimens of ore taken from the Josephine, at West Point, that speak very favorably for the prospects of the mine. The rock was literally spangled with the precious metal, rich in sulphurets and of a character that almost invariably carries free gold in addition to that visible. The quartz was taken from a winze sunk at the head of the 1140-ft level, a distance of 40 feet from the shaft. The ore body has been prospected the entire length of the level and found to be of the character of the samples shown us. The ledge is three feet thick, nearly all of it showing extremely rich and exhibiting every indication of a permanent vein. Operations are being briskly urged, and when stoping from the 140-foot level is commenced the Josephine will give as good an account of itself as any mine in the upper country.

COLUSA.

Quartz Mill.—Colusa *Sun*, Dec. 2: As early as 1853 gold was found on Sulphur creek, just above Wilbur's Springs, and something of an excitement was created throughout the mining camps of the northern part of the State. We carried a prospecting party in a spring wagon to the canyon of Freshwater, and, as there was no road any further, we camped there, awaiting the return and report of our prospectors. They came back mad as hornets. There was not only no gold, they said, but it was not a gold-bearing country. Later, quite an amount of coarse gold was taken out on a small at, near Munch's store, and miners said it came from a rich quartz vein close by; but all efforts to find it failed until lately, when the ledge was run into. It proved so rich that a 10 stamp mill has been erected, and will, we learn, be started next week.

INYO.

Minnietta Belle.—Coso *Mining News*, Dec. 2: Superintendent J. F. Cox says that everything is looking splendidly in their mines. He has completed the wagon road from the valley to the ore dumps, and is now ready to deliver ore to the mill. His dumps are all crowded with ore, and consequently but few men will be employed in taking out any more until the mill starts.

Favorable.—Thos. Luther, an old-time mining operator, with Mr. Eagan, superintendent of the Andes mine, have been here several days examining properties at Lookout, this place and at Lee district, but came more particularly to examine the Emigrant company's mines, at Lee, for John W. Mackey, who, if reported upon favorably by them, will purchase and work them for a large French company in Paris. From an interview with these gentlemen we are satisfied they are well pleased with the property, and the probabilities are that the mines will change hands and active work thereon soon be commenced. James Morgan, Esq., and Mr. McGeary, a very wealthy capitalist, have also been making very thorough examinations of all our properties, and both go away well pleased with all they saw, being particularly elated with the Defiance mine, which they say is the biggest thing outside of the Comstocks they have ever seen. We have nothing to fear from reports they will make, as they both said they were "bound to have some of it." Other parties have also been here during the week, but from none of them, so far as we can learn, will our properties receive any damaging reports. We have good mines, without a doubt, but without capital to develop and work them, we cannot look for any better times in Inyo county for some time to come, although it is to be hoped that the good opinion entertained by all these gentlemen and the reports they are likely to make, will have the effect to relieve us from our present lethargic state.

KERN.

Discoveries.—Kern County *Courier*, Dec. 2: From Mr. W. B. Phillips we learn of the new discoveries of silver leads on the Greenhorn mountains, near the headwaters of Poso creek. The leads lie on the ridge dividing Poso creek from Kern river, about 16 miles northeast of Glennville. About 40 leads have been taken up, and the laborers have deserted the saw mills to prospect for silver. A good deal of excitement has been caused by the good prospects so far discovered.

LAKE.

Change of Base.—Lake County *Democrat*, Nov. 25: The mill at Silverado, on the St. Helena mountain, has been taken down and moved to Sulphur creek, in this county, on the Mazanita mine. Five teams, loaded with the machinery and stamps, recently passed through Long valley, on their way to this mine, which is situated near the famous Abbott mine. The Manzanita mine is bonded to George W. Senn, of the Oat Hills mine, near Middletown.

NEVADA.

Empire.—Grass Valley *Union*, Dec. 3: This mine is the oldest, in the way of continuous work, that exists in this district. We are glad to notice that the underground appearance of the mine is more than encouraging, and that regular and steady profits are made. Yesterday Mr. David Watt, the superintendent, shipped to San Francisco two bars of gold, valued at something above $15,000, the proceeds of a 20 days' run. Mr. James Bennalleck, the foreman of the mine, and one of the best and most experienced miners on the coast, is very hopeful that the old Empire has many years of good future before her.

New Enterprise.—*Foothill Tidings:* An extensive enterprise has just been inaugurated by Messrs. S. H. Dile and Geo. C. King, of this place, and others, which promises big results, as must thousands of its class, which may be started up all over the country. They have taken up something over a mile in length—6,000 feet—of bed of the Yuba river, near Mooney Flat, in this county, and intend to go down beneath the 40 feet of sands and tailings, now resting upon the bed as it was when, years ago, Capt. Dile and his then partners took out $20,000 each, as the result of one summer's work, by the ancient method of damming and turning out the river—a very risky method, as many, who after working hard all the dry season to get where the gold lay, were driven out by early rains before making a dollar, need no help to remember. The plan to be adopted now, we understand, is to go upon the bank of the river, above the freshets and the anticipated rise of the bed by deposit, erect permanent and extensive hoisting and pumping works, and sink an incline down to the level of the bottom of the river, whence by drifts and tunnels, it is thought, the entire gold deposit of the channel can be drawn, without hindrance from the water now at any time flowing in the river.

PLACER.

You Bet.—Dutch Flat *Forum*, Nov. 30: A correspondent furnishes us the following items: Washing at Brown hill, or what is known as the Neece & West claim, was commenced last week. A small blast of 40 kegs of powder was exploded, doing good execution, considering the workmen employed—Chinamen. The Hayward company, D. Rose, Superintendent, is washing with three streams, and is doing well. He has about 30 men working for him, and employs no Chinamen. This company has reduced the wages to two and a half dollars per day, which makes it rough on miners and working men.

Meda.—Colfax *Enterprise*, Dec. 3: This mine is four and a half miles southwest of Colfax. The ledge was discovered several years ago, but the parties locating it were not well enough fixed financially to push the work of developing, hence it was allowed to lay comparatively idle; but it is now in hands that have the means and energy to prosecute the work. In two weeks they expect to have steam to drive the pumps, and in another week the stamps will be put to work. The shaft is now down nearly 100 feet, and the prospects brighten as they advance with it. A drift 100 feet in length from the shaft, northward, shows the ledge to keep up equal proportions with the main shaft, both in width and in richness. About 20 tons of rock already taken out, some of which has been fairly prospected, is valued at $50 per ton.

PLUMAS.

Eureka.—Plumas *National*, Dec. 25: From Mr. W. W. Yeates, who has this week been up in the Eureka country, we learn that the big mine and mill is being run to its full capacity, and that everything indicates prosperity. Eight new stamps have recently been added to the mill, and now 48 stamps are steadily grinding away, together with the large pans, roasting furnaces, etc. All the machinery is run by one large engine, and it seems to have about as much as it can attend to. The superintendent is now having an engine and hoisting works put in the mine a distance of 2,000 feet, to raise the rock from the lower levels. A large working tunnel is being run at the old Mammoth works, three shifts of men being employed steadily, and when it is completed it will tap the main ledge some 500 or 600 feet deeper than the present works. It is the intention to put up a large mill at the mouth of the tunnel in the spring. The most of the supplies for the present winter season are in, and the company are about ready to go into winter quarters.

Irams.—Mr. H. C. Bidwell informed us that his company would have 150 stamps running on good quartz in less than eight months. The Dixie quartz mill has been moved up to the Green Mountain mine, and is again ready for work. A Virginia (Nev.) company have taken up an extension of the new quartz claim on Montgomery creek, near Taylorville, and have several men at work opening their mine. The Frankiin company will soon be ready to commence sending down their shaft on Willow creek, and are now only waiting for a small part of their pumping machinery, which is on the way from the East. The company owning the Pearson blue gravel claims, near Nelson, have about completed their arrangements and will start down with their shaft in a few days. They have got themselves in good fix, and will have the best paying claim in the mountains when they get it under headway.

SIERRA.

Steam.—*Mountain Messenger*, Nov. 25: The Bald Mountain locomotive is proving itself all that was expected. On Wednesday last it took in 35 cars and all the men on one shift in one minute and a half. It has also been ascertained that it burns less coal than was expected.

SISKIYOU.

Siskiyou Ledge.—Yreka *Union*, Dec. 2: We learn that work has lately been resumed on the Siskiyon ledge, on Humbug, which has laid idle for a number of years. The ledge is owned by parties in San Francisco, who have done nothing on it for some time, except hiring a little work done on it from time to time, to keep their title to the mine good. Lately, however, they laid aside their policy of inactivity, and, under the direction of H. B. Warren, Esq., of this city, men have been put to work in the mine and considerable work done. They have out already some 120 tons of rock, which, we are informed, is of excellent quality, and prospects very rich. It is the intention of the company to have it crushed at McCann's mill, situated about half a mile from the ledge. Teams are now engaged hauling the rock to the mill, and the mill will be started up crushing the rock in a few days.

Nevada.

GROOM DISTRICT.

English Company.—Pioche *Record*, Nov. 29: We learn from Charley Heath that the owners of the mines in Groom district living in England have sent £5,000 with which to prosecute work on those mines, and that work will soon commence and be pushed forward with vigor. This English company intend seeing, by a thorough prospecting of the claims of Groom district, whether they are as represented when sold, and we have no doubt but from all indications that they will be well satisfied with the returns from that district.

HIGHLAND DISTRICT.

Furnace.—Pioche *Record*, Nov. 29: Ore is being conveyed from Pioche to this furnace, which being mixed with Highland ore, makes a good flux, so that hereafter there will not be so much trouble experienced in smelting as has heretofore been the case.

The bullion from the Highland furnace in John Roeder's hands was again attached on Monday evening last by Deputy Sheriff Birdsall at the suit of Gerrous and others. John Roeder was given charge of the same as keeper, and it is at his store awaiting any further process of law.

REESE RIVER DISTRICT.

Sure Thing.—*Reese River Reveille*, Nov. 29: It is as sure as anything in the future can be that the new 571-ft cross-cut of the Frost shaft will strike the big ore chimney of the Independence vein, as rich and extensive (if not more so) as it appears in the present workings down to the 500 ft level. The vein in the 500-ft east drift has always been the strongest and richest on the lower side, showing that the best part of the chimney is still below any point yet prospected, and the incline recently started from this (500-ft) level to connect with the 571-ft level is in a large and well defined ledge, carrying high grade ore, with everything to indicate that it will continue so to the full depth to which the incline is to be sunk. The opening of the 571-ft level, with new stopes of ore up to the 500-ft level, will give a large additional supply of ore from this mine; and while the fact has already been demonstrated that this—like all the others in Lander hill—is a well defined, true and continuous fissure vein, it will be proven that the depth to which its ore chimneys extend is only limited by the extent of the vein, and that in the Independence alone, to say nothing of its other ledges, the Manhattan company has a mine which will afford a profitable field of work for years to come.

WASHOE DISTRICT.

California.—Gold Hill *News*, Dec. 6: Daily yield, 400 tons of ore. The ore breasts at all points on the 1500 and 1600-ft levels are yielding rich ore and are showing well. The yield of bullion for the past month insures the payment of the regular monthly dividend of $2 per share at the proper time. The general features of the mine never appeared more prosperous than at present. The face of the south drift in the ore body on the 1650-ft level is still in good ore. A portion of the week was consumed in putting a steel rail on track in this drift, so that the progress made has not been quite as great as it usually is. Sinking the C. & C. shaft is making good progress, the bottom still being in hard blasting rock, and the flow of water very steady and strong. The pump-bob and station, 50 feet below the 1650-ft level, is completed.

Lady Washington.—The main east drift cross-cutting the ledge at the 800-ft level is being pushed forward with renewed energy, the very encouraging indications of the last few days stimulating things considerably. The drift has already passed through 100 feet of ledge matter since cutting the west wall, and shows no indication of the east wall as yet. Several fine stringers of white Comstock ore have been cut through, giving assays as high as $72 to the ton, and more are daily met with.

Julia.—The branch drift from the main south drift, on the 1600-ft level, running to connect with the Ward shaft, is being pushed rapidly, following the vein of quartz and ore recently struck by the main drift. This vein of quartz has widened out to about eight feet, and is of a very fine character. The west cross-cut from the main south drift on the 1800-ft level is in quartz of the most encouraging character. The appearances are that the ledge is concentrating more and more, and that the development of another bonanza on this portion of the ledge is but a matter of time.

Baltimore and American Flat.—Sinking the north winze on the ore vein on the 1050-ft level is going ahead steadily forward, the ledge gradually improving as to greater depth is attained. A drift has been started northward on the vein, at a depth of 50 feet below the 1050-ft level, the face of which is in good ore. The ore in the upraise above the 1050-ft level is also showing a decided improvement.

Ophir.—Daily yield, 220 tons of ore. The ore breasts on the 1600-ft level are showing finely. The west cross-cut from the bottom of the winze on the 1650-ft level is developing a fine body of good milling ore, the extent of which cannot yet be determined.

Dayton.—The flow of water is still strong at the bottom of the main shaft, but is kept under control by a steady use of the pumps. The pumps work splendidly and keep a perfect river of water running from the shaft. There is no better piece of pumping machinery on the Comstock.

Sierra Nevada.—The flow of water at the bottom of the main shaft is gradually decreasing. The north and south drifts on the fourth station level are both being pushed vigorously forward, the face of each being in ledge matter of a very favorable character.

Amazon & Glasgow.—Sinking the shaft is going forward at a rapid rate. The bottom of the shaft is in favorable ground, carrying streaks of fine quartz. The flow of water is increasing, with every appearance of soon draining the main portion of the ledge.

Silver Hill.—Sinking the main incline has been resumed, the pump station and bob at the 600-ft level having been completed. The north drift on the 444-ft level has penetrated to within 100 feet of the Justice line.

Hale & Noacross.—The pumps still keep up their regular stroke of seven and a half per minute, keeping a steady flow of water pouring up from the bottom. It is now reduced to a point about 20 feet below the 1900-ft level.

Leviathan.—Cross-cut No. 2, at the 600 ft level, 50 feet north of cross-cut No. 1, is pushing eastward into the ledge. Its face is already in ore, and will doubtless develop us good a width of pay ore as is already cut through in cross-cut No. 1.

Justice.—Daily yield, 300 tons of ore. The Pacific mill has been added to the crushing capacities of the mines, and the ore stopes got north on the 400 and 600-ft levels are still producing fine ore, the ledge holding a uniform width of about 30 feet. A winze is being sunk on the ore vein below the 400-ft level, which is showing ore just as rich as that found on any of the levels, either above or below. The appearances are that on the 500, 600 and 700-ft levels the body of ore developed extends much farther to the northward than was ever expected by the most sanguine experts that have ever examined the mine. On the 800 ft level, cross-cuts Nos. 1 and 2 are both steadily advancing, both showing more quartz and ore, and an improved appearance in the formation penetrated. The winze sinking on the ore vein below the 800-ft level is steadily developing fine ore, with every appearance of its extension downward to the 1,000-ft level. The southeast drift on the 1,000-ft level is encountering a gradual change in the rock formation that betokens a near approach to the main ledge at that point. The making of dividends is now only a matter of time, and may be looked forward to as a matter of certainty.

Con. Virginia.—Daily yield, 400 tons of ore, keeping the mills running up to their full crushing capacities. The ore breasts on the 1400, 1500 and 1550-ft levels are all showing well as usual. The regular dividend of $2 per share, aggregating $1,080,000, was declared yesterday. On the 1700-ft level the north drift has been cleaned out, repaired and work in the face begun. The side railroad track to the C. & C. shaft, for the shipment of ore from that point, is nearly completed.

Yellow Jacket.—Sinking the new shaft is making splendid progress. It is now down 155 feet. The side track of the railroad is nearly completed, which will make the site of the shaft one of the most convenient on the line of the Comstock. The air connection recently made with the Imperial is gradually cooling every portion of the mine and placing it in a better condition for work than for many months past.

Imperial Con.—Sinking the north winze below the 2100-ft level is making good progress. It has very nearly reached the point at which it is intended to start a drift south to connect with the north drift now being run from the bottom of the south winze. The pumping machinery is now working splendidly, and the flow of water gives but little trouble.

Bullion.—The south drift on the 1500 ft level is developing a splendid body of quartz with every indication of finding paying ore at no very distant day. The heat in the drifts on the 1500-ft level is intense and necessarily makes the progress very slow until better air can be obtained.

North Con. Virginia.—A fine working station has been opened at a depth of 1,100 feet; and two drifts, one east, the other west, started to cut the ledge. The opening of this level on an entirely new and unprospected portion of the Comstock ledge is being looked forward to with deep interest by not only the present stockholders but by the entire mining fraternity of the lode, it being the opinion of many of our best experts that the development of a paying mine in that vicinity is only a matter of time.

Overman.—The north drift on the 1200-ft level has been stopped for the present. The south drift on that level is rapidly advancing, with very favorable ore prospects. The shaft has reached the 1400-ft level, below which point a sump is being finished. The ore and ledge developments on the levels above are almost a sure guarantee that when the vein is opened a paying mine will be developed. The erection of the new pumping machinery is rapidly approaching completion.

Mutual.—This mining location lies some five miles to the northward of Virginia City, on the direct range of the Comstock. It is principally owned by San Francisco men, and is considered very promising property. They have sunk a shaft in the ledge, which crops out strongly at the surface, and at various points cut small streaks and bunches of ore which give excellent assays.

Belcher.—Daily yield, 200 tons of ore. Sinking the main incline is not doing so well on account of the strong flow of water encountered.

Sutro.—Work is about being actively resumed in this mine after a rest of some months. The old tunnel, which is 1,200 feet in length, is to be pushed ahead to the ledge, which it is expected to cut in about 125 feet further.

Trojan.—The ore body on the 300-ft level is opening out finely, and stopes are being started to extract it.

Continued on Page 388.

Treating Nickel Ores and Alloys.

The London *Mining Journal* says: Although the recent attempts to form a European company to develop the nickeliferous deposits of New Caledonia did not prove successful, there is no doubt that the New Caledonia ore will come largely into the market, as their improved methods of treating it are not without interest. The invention of Mr. Alex. Parkes, of Granby Hill, near Birmingham, has mainly for its object to obtain nickel alloys and nickel from New Caledonia nickel ores and other oxidized ores of the metal. For this purpose he fuses oxidized compounds of Caledonian ores of nickel with oxide of copper together with fluxes, in order to collect the nickel and copper in a metallic state reduced together from their oxidized condition to an alloy so fusible that it can be smelted in a reverberatory or other furnace, and when properly melted it is tapped into sand beds, by preference metal and slag together; when cool the nickel and copper alloy is found well separated from the slag, or the slag may be first skimmed off the surface, as in copper smelting, and the mixed alloy run into water to granulate it.

The nickel alloy, whether in pigs or granulated, is now placed in a calcining or roasting furnace, and submitted for about four or five hours to calcining or roasting, in order to oxidize a considerable portion of the alloy, especially the iron, it may contain, when the heat is increased and the alloy melted down with silica or lime in the roasting furnace; by this treatment most of the iron and other impurities are separated from the nickel and copper. If not all taken out oxide of copper is thrown on from time to time to fuse the alloy from iron in the form of a black subcrust slag, that is skimmed off after every addition of oxide of copper from time to time, and when the workmen finds from experience that all or most of the iron is practically separated the alloy is either tapped out into sand beds or water, or ladled out with iron ladles and poured into iron molds. From two to three cwts. of oxide of copper will be sufficient for one ton of rough metal. Or in place of roasting or calcining the crude nickel and copper alloy as above named he melts it down at once in a reverberatory furnace, and adds oxide of copper (by preference mixed with silica or lime or ammoniacal substances) from time to time, free and remove off the slag until it is found that all or most of the iron is oxidized and separated in the slag.

The alloy, well freed from iron and other impurities, may be at once used in the preparation of alloys called German silver, by fusing it with varying proportions of copper and zinc; but before doing so he prefers to refine and toughen the alloy (after it has been roughly refined), to separate any manganese or other impurities as before described. This may be done in crucibles, or reverberatory furnaces, or in a cupellation furnace; the alloy is to be fused, and if any impurity arises as more or other deleterious matter remains, more oxide of copper is added, and after the reaction is finished the flux is removed by skimming it off, and then he employs a refining process similar to copper refining by poling, or as refined by means of a toughening flux of borax and then spar with a little carbon or other reducing flux. The metal thus obtained is of the finest quality.

In carrying out the first part of his process on a large scale at the New Caledonian nickel works, Birmingham, Mr. Parkes has found the following proportions of flux and oxide of copper most satisfactory. For one ton of New Caledonian nickel ore of ten per cent. nickel he employs two to three cwts. of oxide of copper, three to four cwts. of lime spar or cryolite, two to three cwts. of anthracite coal, one-half to one cwt. of rock salt; all the above substances are by preference ground so as to pass through a sieve one-eighth inch mesh, and being well mixed and made damp with water to prevent loss when throwing the charge into the furnace. The charge is melted in a reverberatory furnace in from four to five hours; in order to collect the alloy of nickel and copper formed by fusion of the above proportions of substances together, he puts into the melted charge from one to two cwts. of metallic copper in a granular state about one hour before tapping out the charge. This addition collects the nickel alloy more completely. He either runs the whole of the melted charge into sand beds, or he refines and tops it into water.

Another part of his invention consists in fusing new Caledonian nickel ores and other similar nickel ores, especially if of low percentage, together with sulphur or sulphate of baryta, together with carbon, and the fluxes above mentioned; by this means a very fine sulphide is formed, easily converted into nickel of the finest quality, or an alloy of nickel, by the method first above named, or by the well-known wet method of preparing nickel. The fluxing will greatly depend upon the proportion of earthy matter in the ore. He also employs iron pyrites, copper pyrites or arsenical compounds as fluxes to the New Caledonian ores and sulphate of soda or rock salt. For one ton of New Caledonian ore—say, of five per cent.—he finds the fluxing is well effected when 20 cwts. of nickel ore, one to two cwts. of fluor spar, two cwts. sulphate of lime or gypsum, two cwts. carbon anthracite, all the substances are ground and passed through a sieve one-eighth of an inch in the mesh, well mixed, wetted with water and charged into a reverberatory furnace by preference. The charge will melt well in from four to five hours, and may be run out altogether into sand beds or first skimmed, and the regulus run into water to granulate it; or the regulus may be ground by machinery. The regulus is to be either calcined and fused with oxide of copper, to collect and form a metal alloy, as at first described, and treated in the same way, or the regulus may be treated by the well-known method of refining metal. In place of fluor spar he sometimes uses cryolite and sulphate of iron or copper as fluxing mediums with salt and carbon in obtaining a regulus.

A correspondent of the same journal further sends the following additional information on this subject:

From the recent discoveries of rich nickeliferous ores in New Caledonia and elsewhere some interest naturally attaches to improved methods of treating them, more especially when they emanate from such thoroughly sound metallurgists as Messrs. Christofle & Bouvillier, of Paris. The ores of New Caledonia, to which they are more particularly giving their attention, consist chiefly of silicates of nickel and of magnesia, containing varying quantities of iron and alumina; average samples give between 12¾ and 13½ per cent. of protoxide of nickel. The peculiarity of these ores which distinguishes them from the ores hitherto treated in Europe, consists in their neither containing sulphur nor arsenic, but a remarkable quantity of magnesia in varying proportions, the total weight of the magnesia and of the nickel is, however, almost invariably about equal, these two bases by reason of the laws of isomorphism being substituted one for the other.

The nickel ores of New Caledonia contain considerable quantities of iron in the state of silicate and of oxides. The iron is not combined with the nickel, but forms a separate combination, either mingled in alternate layers with the silicate of nickel, or diffused in the mass and without apparent order, but so as to be easily recognized by the reddish color of the ore. The mode of treating the ore by melting it directly after having pulverized it is open to the objection that the whole of the iron contained in the ore forms a combination with the nickel reguli or the fused nickel from which it is very difficult to eliminate it. In fact, in order to effect this elimination it is necessary either to resort to a puddling process at a high temperature, which, in order to scorify the iron, causes considerable quantities of nickel to pass off in the scoria, and produces great and costly waste, or to employ a process of refining by cementation, which is long and costly as if the whole of the ore were subjected to the direct action of coke.

To obviate these difficulties Messrs. Christofle and Bouvillier first treat the ore by a wet process to remove the iron and treat the cleansed nickel ore by a dry process. In separating the iron the ores are dried and washed in order roughly to separate the portions rich and poor in mineral respectively, each being afterwards treated separately. In the separation of the ferruginous matter from the nickel the silicates and oxides of iron are first attacked and dissolved before the silicate of nickel, care avoiding the iron to be separated from the nickel in the first treatment by a wet process. By means of a mechanical lixiviation with hydrochloric acid in suitable apparatus by the ordinary system, the iron is dissolved out by means of the acid. The solutions thus obtained contain the whole of the iron, the easy metals and a certain quantity of nickel. As soon as the pulverized ore loses its ochreous tint, and the silicate of nickel appears with a beautiful green color, the operation is to be stopped and the ore tested to ascertain if it still contains iron. If it is found to contain iron it is to be again digested with fresh acid, care being taken not to dissolve too much of the nickel. If the ore is then found not to contain any more or but a small quantity of iron, it is washed and dried, and the water in which it has been washed is put aside to be treated in order to separate the nickel which it contains.

After the process of solution is completed the solutions will contain iron, nickel and magnesia, and they are treated in such manner as to separate the iron and the magnesia and to collect the metal by one of the processes of treatment hereinafter described; other acids than hydrochloric acid may also be employed for the purpose of separating iron from the nickel contained in Caledonian ores, in order to enable the ores to be subsequently treated by the dry process. For example, formic acid, acetic acid or citric acid may be used, providing that the acid of iron contained is soluble. In this case oxalic acid is preferred by reason of its possessing the advantage of forming at the same time an insoluble salt of nickel, and in consequence of the whole of the nickel remaining in the ore, which result does not take place when hydrochloric acid is employed.

When oxalic acid is employed the ore is reduced to a fine powder in heated ten, and in sufficient quantities with a concentrated solution of oxalic acid in suitable vessels, after heating for several hours when it has been ascertained that the insoluble powder does not contain any more iron, the liquid is run off and the ore washed. The whole of the easily oxidizable of iron, manganese and oxalic acid in excess are afterwards treated by milk of lime. The oxalate of lime produced is digested with sulphuric acid, in order to regenerate the oxalic acid, which may then be re-utilized in the manufacture. As oxalic acid is formed when an organic substance is heated in presence of matter capable of imparting oxygen to it, the result will be similar whether the acid be prepared before hand or consumed by the reaction of the elements which serve for its preparation in presence of the ore.

In carrying out the subsequent dry process for the treatment of the ore, the ore after having been washed and dried and re-united with the ore resulting from the first sorting, is afterwards mixed with the quantity of pulverized wood, charcoal, and flux, suitable for producing the reduction and fusion of the metal, and a very fluid scoria. The flux which gives the best results consists of a mixture of car onate of soda and carbonate of lime, the proportions of which may be varied according to the nature of the ore and the amount of silex and magnesia which it contains; it possesses, moreover, the advantage of scorifying any iron which may still remain. Preliminary trials will indicate the proportions to be employed; other fluxes may, however, be used, such, for example, as fluor-spar, borax, vitreous salts, and other known fluxes, with a similar result.

The ore thoroughly mixed with charcoal and flux is placed in successive charges and highly heated, either in a crucible heated by itself in an air furnace, or in crucibles heated in a special furnace, or in a reverberatory furnace heated directly by coal, or a gas furnace on one of the known systems, such, for example, as Ponsard's, Siemens', or others, or in any other suitable apparatus by running off the scoria from time to time, or by skimming it off with a ladle, the progress of the operation may be ascertained, and fresh quantities of mixture of ores and flux may be added; thus increasing the amount of product obtained from the operation. The result is commercial nickel, which may be run into ingots, shot, and the like. Various modifications in detail are of course necessary, according as slightly different qualities of ore are under treatment, but the above will convey a general idea of the process.

Important Land Decisions.

WASHINGTON, November 15th.—The recent Supreme Court decision in the case of Frances *vs.* Fyan and others, from the Circuit Court in Missouri, has a vital California interest. It holds that swamp land patents cannot be impeached by actions at law, and overruled the old decisions of the California Supreme Court. The land in dispute was vested in plaintiff through a purchase from the Missouri Pacific railroad company, to whom it had been certified in 1859, as part of the land granted to aid in the construction of said road. To overcome this *prima facie* case, the defendant introduced the patent issued to Missouri under the swamp land act of 1850, and it was admitted that the defendant has a regular chain of title under this patent. At the stage the plaintiff offered to prove in rebuttal, by parol evidence, that the land was not swamp or overflowed and unfit for cultivation, and that the greater part thereof had never been so since 1849. The court below ruled that since the defendant introduced the United States patent to the state for the said land as swamp land, this concluded the question, and ruled out the parol evidence, and the plaintiff accepted. The Supreme Court sustains the court below, under its previous decisions, that the swamp land act was a grant in present, by which the title to those lands passed at once to the State to which they lay, except to lands admitted into the Union after its passage. The court holds in substance that parol testimony cannot be received to overturn the decision of the Secretary of the Interior, as declared in the patent, that floor having been made by law the tribunal, whose decision of such questions was controlling. Judge Field called the attention of the Court to a series of California decisions, having a different view from that held by the Supreme Court. In this case, Judge Miller's opinion on behalf of the Supreme Court says: "In reply, with all respect for that court, we are unable to concur in the views therein expressed. The principle we have laid down is in harmony with the system which governs the relations of the courts to the officers of the Executive Department, especially those having charge of the public land as we have repeatedly decided, and we must abide by them." The Court further holds that there is no conflict between its present decision and the former one in the case of the railroad company against Bird.

Decisions of the Secretary of the Interior.

Copp's Land Owner for November reports a decision by the Secretary of the Interior in effect as follows:

The filing of a declaration of a preemption settlement before settlement does not invalidate a right in absence of an adverse claim. All ex parte evidence filed after the close of the hearing in a contested land case, before the local land officers, must be rejected except as a basis for an application for a new hearing. All documents, all exhibits, filed in the case, when the same have passed beyond the jurisdiction of the general land office, must be passed upon by the department proper, and no paper thus filed should be referred by the general land office.

In school grants, where a party settled on land in the 16th or 36th section, long prior to the survey thereof, but has exhausted his preemption privilege, he cannot by a homestead entry prevent the tract from passing under the school grant.

Regarding swamp lands, it says that to settle upon lands of a swampy character would raise such a doubt of the settler's good faith, as upon a proper application to justify an order for an investigation. At such a hearing the character of the land at the date of the settlement should be determined. When notice of the selection of a tract by the State is received at the local land office the State should be notified before proof and payment is made by the settlers thereon. But where patents have been issued under the former ruling of the Interior Department, cases will be considered *res judicata*.

Timber culture.—Land covered by an invalid State section may be entered under the provisions of the timber culture act, or otherwise subjected thereto.

The Mines at Eureka.

The Eureka *Sentinel* contains the report of the County Assessor, from which we take the following:

Eureka County,

The youngest of the 14 comprising the commonwealth of Nevada, has, since its formation, steadily advanced in prosperity, and to-day, with its vast mineral resources, rapidly improving agricultural and grazing lands and the facilities offered to the patrons of all industrial pursuits, it ranks second to but one in the State. The acknowledged growth of the material industries of the county has given encouragement to capitalists seeking profitable investments, and at the present time negotiations are pending, which will, in a short time, result in the sale of several valuable mining properties and the employment of many additional miners in the active development of the mines. During the earlier portion of the present season the demoralized condition

Of the Silver Market

Crippled the mining industry of the county to a great extent, and for a long time leaving it a matter of grave doubt whether the mines could be worked at the prices offered for their product, but happily the market recovered itself and soon placed the value of silver at a figure enabling the miners to resume their vocation and the companies to continue operations without loss, and, in several instances, with large profit.

Eureka Mining District.

During the past year the developments made in many of our leading mines has been attended with gratifying results. Large bodies of rich ores have been found. Among the most important transactions taken place has been the sale of the Matamoras mine to Messrs. Steele & Sturgis, o Chicago, who are now here. They have had a new furnace erected on the site of the old Buttercup smelting property, which has also been purchased by them, which is now in successful operation. A number of miners are also in their employ engaged in developing their newly acquired property, which promises to be one of the most valuable in the district.

Following is a report of the mines for the quarters as named, which, taking into consideration the general depression caused by the silver decline, presents a creditable showing. The ores from many of the mines carry a large percentage of gold, which gives Eureka an advantage over many of the mining districts of Eastern Nevada:

For quarter ending—	Tons ore extracted.	Gross Yield.	Tax.
Sept. 30, 1875...	24,877	$410,708	$5,091
Dec. 31, 1875 ...	23,903	661 419	7 923
March 31, 1876 ..	4,810	370 078	3,664
June 30, 1876....	7,537	855,824	1,867
Totals.....	56,127	$2,197,634	$12,705

The foregoing does not show the real condition of the mines and mining interests of Eureka county, as the mines have not been so energetically worked as formerly for reasons before stated, and, as a consequence, the bullion tax shows a material reduction in comparison with the other years. The mining outlook of the district never looked better. There are 18 furnaces in the county, and three quartz mills, with 45 stamps.

Gravel Mining.

There is no kind of mining so profitable to owners of claims as gravel or hydraulic mining. After a claim is opened the expense of running is light, compared with any other kind of mines, and the proceeds are generally greater. A gravel mine is not so good a thing as a quartz mine for the community surrounding it, because there are fewer men employed upon it, but the owners reap greater returns for their outlay. There are miles of such claims unopened in our country, and if capitalists of other parts desire to make paying investments, they have only to examine the prospects here, and we feel confident they will conclude no place on the coast offers superior inducements. We have a couple of miles of undeveloped channel, back of our town, that is known to be of the richest character, but the owners of the several claims on it are unable to make proper opening, and are waiting for capital to come to their relief. There are miles of ancient river beds on the San Juan ridge in the same condition. The development of the North Bloomfield company proves the richness of the channel. There are grounds adjoining the claims of the above company just as rich, and which can be opened for a quarter of the capital used for opening that claim, yet they lie idle. We understand that a very rich discovery has been made on Alta hill, near Grass Valley, where parties have been prospecting for the old channel known to run through there. In short, almost any part of our country offers inducements for the investment of capital, not found in any part of the State, and we are in hopes some of the bonanza kings of San Francisco will find it out one of these days.—*Nevada Transcript.*

Mining Prospects of American Flat.

From the earliest days of the discovery of ore on the Comstock up to the present time, says the Virginia *Enterprise*, it has been a vexed question with many as to whether American Flat has a genuine fissure lode or not. On the solution of this question hangs its future interests, so far as successful mining is concerned. Good mining men and excellent experts have differed in opinion as to the merits of the section, and differed honestly. There are those on both sides of the question who differ interestedly still. Then it is that men are found who contend most energetically on both sides of the question. But the question is an important one, and one which can only be answered by the rocks themselves. So the answer is being outwrought day by day with shovel and pick and drill, and men are waiting for the result.

That the region about American Flat is an early day produced good ore cannot be denied. The line of croppings to the west is distinct and well marked. But the formations near the surface were found to lie very flat and hence people said it was a cap which, in the vast surface disturbances of the long ago, had been hurled from the vicinity of the Comstock and flopped over into that section. While all admitted that there was ore there, some held that no genuine fissure vein existed; or, if any, it was very small and only a feeder of the great Comstock lode. Others contended as strenuously that the line of croppings indicated a genuine lode and set out to demonstrate what they believed to be the fact and to back their opinions with their money.

It is not the intention of this article to attempt to decide this question of yours, although in the mind of the writer there no longer exists any doubt upon the subject. Opinions have been given often enough on the subject. What men want are facts. It was with a view of furnishing a few of these, which might have a general bearing on the subject, that the reporter asked and obtained permission of E. Strother, superintendent of the Baltimore Con. and American Flat mines, to visit the lower levels of the former mine and examine the formations there encountered. The Baltimore Con. is the pioneer mine of American Flat so far as deep mining is concerned, being now at work opening up the 1450-foot level.

With the permission granted, the reporter yesterday visited the mine and was dropped to the 850-foot level. Here the cage was exchanged for the giraffe and the descent continued on the incline to the 1050-foot level. The flat situation of the upper strata has carried the ledge far to the east, and in this direction the drift was followed. No attention was paid to measurements, as they were unimportant. After following for some distance through west country rock, what is known as the red formation, being a composition of quartz, porphyry and clay, was reached. After running a while in this formation, a turn to the east of north was made through a cross-cut and black clay was encountered. Next to this came blue clay and then vein porphyry. After this came a fine ledge of quartz, bearing bunches and streaks of high grade ore.

The formation is full of interest and bears important testimony on the general question under discussion. It has nearly a polar trend. The dip is the same as that of the Comstock in all our principal mines. Its thickness is not determined, but it is not less than 150 feet, probably 200 and much more. It has been cut about 90 feet in one direction from the drift and 40 feet in the other, and the full width not yet reached. Here an incline upraise has been made 85 feet, following the ore vein all the way. From this upraise much good milling ore has been taken. The head is still in the same formation. At another point further north, a winze has been sunk about 50 feet on the dip of the ledge. The ore vein is wide and richer as depth is gained. Assays from this part of the mine average about $65. This is the testimony of the 1050-foot level.

After carefully examining the formation in various places the incline was again reached and the descent to the 1450-foot level made. A drift running to the east was followed for some distance, when again the black clay wall was reached. Against this rested the blue clay, followed in turn by the vein-porphyry carrying strong stringers of quartz, in which was found some rich ore. The formation is identical in its essential features with that 400 feet above, but gives greater promise of concentration. The quartz both here and above is of that lively and porous appearance which delights the prospector and indicates no small vein. On this lower level the drift is not yet in far enough to prospect the vein, but may penetrate ore at any moment.

That the testimony of these two levels may have its full weight, our previous knowledge of the workings of the mine enable us to say that this same vein-formation was struck first on the 225-foot level, and a rich but small seam opened up. This led to an ore-body some 25 by 50 feet, which was stoped out. Again on the 450-foot level the vein was followed 300 feet. A winze was sunk thereon 125 feet and an upraise made thereon 200 feet. The vein carried ore all through these distances. The dump near the mine is yet filled with what was then taken out. It was again encountered on the 750-foot level and followed 200 feet. In places it was from 25 to 30 feet wide. This vein has not been followed every foot of the way down, but from its similarity of formation and its position there can be no doubt of its identity.

Useful Information.

The Danger in Kerosene Oil.

The *Polytechnic Review* gives an article on the danger in kerosene oil as used in households, and tells how the quality may be tested:

It is simply to be set down to good fortune if one who has employed the light oils for household purposes has escaped injury, since no amount of care can avail against the inevitable result which must follow one accident. It is easy to understand how persons ignorant of the highly dangerous character of the light petroleums may unknowingly make use of them in the manner above named; but it is really a matter of concern and surprise that so many, even of those who are thoroughly aware of the nature of the incendiary they are introducing into their households, are nevertheless thoughtless or indifferent enough to continue the suicidal practice—for no term can be too strong to properly characterize the fearful nature of the risk one is constantly running while employing these oils in the household.

There seems to exist a notion that the explosive or inflammable properties of the light petroleums can be effectually neutralized by adding various substances to them. The patent office records for the past few years contain numbers of claims for such mixtures of naphtha or gasoline with a great variety of substances too numerous to mention.

Whether or not the inventors of these recipes really have faith in the claims they present is a matter of small importance; but the deceptive illustrations which they are able to offer in vindication of their assertions, no less than the attractive names which they attach to their incendiary mixtures, are the sources of many distressing calamities.

There is one simple and, for practical purposes, satisfactory method of determining the character of all such mixtures, and which applies equally as well to the common oils. Let a few drops be poured into a saucer, apply a match; if the material burns reject it as unsafe. The fact that the material can be set on fire at the ordinary temperature of our dwellings should be a sufficient evidence to a person of ordinary intelligence that when employed in the household it may, at the first thoughtless or careless act, become the cause of a frightful accident.

Now for the reason why these dangerous oils find their way into the market in defiance of legal prohibition.

The crude petroleum, as it comes from the wells, is not a simple substance, but consists of a mixture of a number of oils. The operation of refining the crude product consists essentially in subjecting it to a system of frictional distillation, whereby it is separated into some six or seven products to which the commercial names of rhigolene, gasoline, naphtha, benzine, kerosene, etc., are attached.

The benzine or naphtha makes up generally about 15 to 20 per cent. of the crude oil, and for this demand in the various industrial arts is by no means equal to the supply, in consequence of which it commands but an inferior price in the market: in fact, considerably less than that demanded for the burning oils proper. Here, then, exists a direct temptation to dishonest or ignorant manufacturers and dealers to adulterate their stock of burning oil with oils of inferior price and dangerous quality. To what extent this reckless practice is carried on, the community have no just conception, but the writer feels safe in asserting that it is as general as any of the trade adulterations.

So general has it been practiced, in Philadelphia at least, that only three years ago an examination of 3,000 oil samples sold in the various parts of the city and its suburbs, showed that not more than one-twelfth of one per cent. of all the burning oils sold in the shops of this city were of sufficiently high grade to pass the fire test; and it may be added that there is no reason to suppose that any improvement of this condition of things has taken place since the time when the examination was made. The constant occurrence, therefore, of accidents with coal oil—so long as the cheap and highly dangerous products of the refinery are indiscriminately used to adulterate the comparatively safe burning oil, the kerosene, or doctored, with equal impunity into the numberless burning mixtures with alluring names that meet one at every turn—is a perfectly natural result, and one that should occasion no surprise. And so long as inspection is a farce, and the inspector and vendor are beyond the pale of legal accountability for their deeds of omission and commission, just so long will coal oil murders and disasters continue to be deplored.

Wash and White Lining for Brick Fronts.—The following is said to have been found a successful plan in Chicago for giving a brick front a durable red wash: Venetian red and Paris brown, in proportion to suit the taste, are mixed with a quantity of water to make a heavy wash. With this the walls are well coated. To settle the color to the wall, and prevent its washing off by the rain, a wash with diluted muriatic acid (one-quarter acid) is given over the painted surface. The mixture forming the white lines or joints is made of settled white lime, to which is slowly added plaster of paris, kept stirring until the mixture is past setting, then mix a little fine sand to keep from cracking, and work into the consistency of glazier's putty. This putty is then applied to the wall by two men, along a straight edge, and with a beading trowel, the distance of the joints having previously been measured. Care should be taken in applying this putty to press it strongly against the wall to prevent any water from creeping between it and the brick. We have never seen any painted or washed fronts, however, which were as handsome as those treated with plain boiled linseed oil. It takes a great deal to make a good job, but when it is done the appearance cannot be equaled by any method of painting. The front requires oiling from time to time afterward, till the surface is thoroughly protected, then occasional coats may be needed, but not often.

Varnish for Cane and Basket Work.—According to the *Hessisches Gewerbeblatt*, has prepared after the following recipe, is used to cover split and colored cane: 25 grains of good linseed oil are heated in a sand bath, as long as a drop of it, poured on a cold stone, does not run when the stone is inclined, and when touched with the finger it feels throaty. Then are added, first in small portions, one pound fat copal varnish, or some other fat varnish. The heating of the linseed oil must not be carried too far, because otherwise it would not be completely dissolved in the copal varnish, and the vessel wherein the copal varnish is heated must be large, because by the addition of the linseed oil a great deal of frothing takes place. When cold, the required consistence is given to the varnish by mixing it with turpentine oil. It soon dries, preserves a sufficient elasticity, and may be applied with or without addition of colors.—*Stammer's Ingenieur.*

The Alligator Business.—Between 17,000 and 20,000 alligator skins are tanned yearly, which are consumed by boot and shoe manufacturers in every portion of the United States, as well as exported to London and Hamburg. The alligator is formerly came almost entirely from Louisiana, and New Orleans was the great center of the business. The Florida swamps and morasses are now the harvest fields, and Jacksonville, in that State, the great depot. The alligators often attain a length of 18 to 20 feet, and frequently live to an old age. The hides are stripped off, and the belly and sides, the only portions fit for use, are packed in barrels, in strong brine and shipped to the Northern tanner, who keeps them under treatment from six to eight months, when they are ready to be cut up. So far the leather has been mainly used in the manufacture of boots and shoes, but handsome slippers are also made of it.

Fish Skin Leather.—The *Commercial Bulletin* has the following: Shoes have been manufactured in Gloucester, Mass., from the skin of the cusk. They are said to be strong and give evidence of durability. If the new material for shoes proves what it promises, it will open up a new market for fish skins which will no doubt be highly profitable. A patent has been applied for. The cusk belongs to the cod family; and we see no reason why the skins of a large number of useless fish that are now swimming about doing nothing may not be utilized. They would be glad of the chance.

Emery grinding stones were until now almost exclusively obtained through a mixture of gum, shellac and emery. When they work with rapidity, the shellac is softened, and the grinding stone, becoming greasy, causes to polish. This difficulty is remedied by using, instead of shellac, soluble glass; this is done in certain German manufactories, the grinding stones of which are not corroded. They may turn at a velocity of 1,000 to 2,000 turns, without losing their form.—*Revue Industrielle.*

Good Health.

Causes of Mortality in England.

The following article from our exchange, *Iron*, will be read with deep interest, as several valuable lessons can be drawn from it: "Though there is only one way into the world, the avenues leading out of it are innumerable. According to the registrar general, however, whose report for 1874 has just been issued, two-thirds of the deaths in England in that year, and presumably in other ordinary years, occur from one or other of 15 causes. Bronchitis heads the list, killing over 53,000 persons; next comes phthisis, which answers for more than 49,000; then atrophy and debility, for nearly 40,000, mostly young children. Old age, which Dr. Farr qualifies as that which should be the highest in the list, was the cause of 28,604 deaths, more than 26,000 of which were of persons over 65 years of age, some of them centenarians, the proportion of men to women being as 12 to 76. Heart disease, apoplexy and paralysis are increasing, doubtless owing to the increased worry and rush of social life. Cancer, too, is growing more fatal, but consumption appears to be on the decrease. Hydrophobia is twice as fatal as it was 20 years ago; and the number of violent deaths was 17,920, the highest number yet registered. Nearly all were from accident or negligence; but the executions reached the unusual number of 18, and there were 1,592 suicides. There were 1,249 persons killed on railways in some way or other. The year's returns show 1,313 persons killed by horse conveyances; tram-cars killed 62, omnibuses only 55 persons. By cabs 61 persons were killed, and by carriages 82, and this limitation of the numbers is noted as implying great skill on the part of the drivers in streets often crowded. There were 942 deaths from injuries in coal mines, and 118 from injuries connected with copper, tin, iron and other mines. Deaths by poisoning increased to 461, about a third of them being ascertained suicides. There were 25 boys and men, nearly all following outdoor occupations, killed by lightning. Sunstroke was fatal to 90 persons, and 111 deaths were ascribed to gelatio and exposure to cold. There was a death from the bite of a fox, from the bite of a rat, from bite of a leech, from the sting of a hornet, and two from sting of wasp. An epidemic of scarlet fever raised the mortality of 1874 considerably, and there was an increase in the deaths from excessive drinking. An augmented death rate from infantile diarrhœa may, it is suggested, have been owing to the mixture of sewage with water. The deaths from accident and from the other last mentioned causes, as well as from many of those previously enumerated, with one exception, might be greatly diminished by proper care on the part of the State and of individuals."

Hiccoughing to Death.

The Pottsville (Pa.) *Miner's Journal* relates an incident of a man named Hoskins, who drank cold water on an empty stomach, and a hiccough set in. Every remedy known to his friends was tried, but without avail. A doctor was sent for, who administered remedies, uselessly, for he died. A reader of the Chicago *Tribune*, into which paper the story was copied, says he has never known the following simple remedy to fail:

Whenever attacked by hiccough, get some one to stand behind you and place the forefinger of each hand in your ears so as to stop them. Then between the finger and thumb of your left hand press the nostrils, in order to stop breathing through them. In your right hand take a glass of water, and, while ears and nostrils are closed, drink a good draft. This will instantly cure the hiccough.

I am not aware that there is any particular virtue in the water. I have seen the cure effected by a draft of ale or porter as well as water, and believe that a drink of any liquid, warm or cold, would have the same effect, although I have always seen it used cold. I attribute the cure to the momentary stoppage of breathing; but, whatever the cause, my experience for years has always proved it a success.

Treatment for Boils and Carbuncles.—Dr. Earl in the *British Medical Journal* says: Boils and carbuncles are not mere inflammations and sloughings of cellular tissue, but specific diseases. They are parasitic, and as such endowed with a definite life and history. In their early stages they may be infallibly destroyed and aborted by destruction of their central stem or root, and even after this stage is passed they may generally be destroyed, and in all cases, at the very least greatly modified by the free application of carbolic acid. To produce this result the acid must be freely introduced into the central portion of the disease, and also into any other part where an opening exists or is formed artificially. The strength of carbolic acid used was four or five parts to one of glycerine.

Poisoning by Hats and Boots.—A German medical journal quoted by the Cincinnati *Clinic* reports a case of severe pustular eruption of the forehead, extending over the face, and which was ascribed to the aniline dye in the leather of the hat band. We have seen a case of severe poisoning of the legs above the ankles, evidently produced by the leather linings of a pair of half boots. We have also under observation a gentleman of this city, a leather dealer, who has been repeatedly poisoned by handling a certain kind of leather. In this case the affection was eczematous and followed by permanent macules. The gentleman attributed the effect to sumach used in the preparation of the leather.—*Pacific Medical and Surgical Journal.*

Burns and Scalds.—The recent fearful explosion on board the British ironclad, *Thunderer*, has called out the publication of many recipes and remedies. Among them all, the following contributed, by an old and experienced physician, has the merit of convenience and readiness. The remedy is simply this: The common whiting of commerce (found in nearly every kitchen) reduced by cold water to the consistence of thick cream, is to be spread on a light linen rag, and the whole burned surface instantly covered, and thus excluded from the action of the air. The case it affords is instantaneous, and it only requires to be kept moist by subsequent occasional sprinklings of cold water. Painting the surface with ink soon relieves the pain of a small superficial burn.

Effect of Violent Pain.—Mantegazza (*Hirsch Jahresbericht,*) by experiments proved that in animals violent pain produced loss of appetite, dyspepsia, nausea, arrest of the digestive process, vomiting and diarrhœa, and if continued, great weakness and considerable loss of weight and greater sensitiveness to all injurious agencies. In man we find that severe neuralgic pain produces dyspepsia, want of appetite, coated tongue, pallor and anæmia, weak pulse, cold extremities, depressed, excitable states of the system, great sensitiveness to external injurious influences.

NEW ADVERTISEMENTS.

Hendy's Challenge Ore Feeder, S.F.; Josephine Gravel Mining Co.—Assessment.

CENTENNIAL AWARDS.—The list of awards decided upon by the Centennial Committee of Appeals was made public on the 4th inst., and comprises the following to Pacific coast exhibitors: California—Fred. Ogden, automatic ore feeder; I. Landsberger & Co., champagne; Frederick Oppenheim, San Francisco, single and double buggy. Nevada—Allen A. Curtis, for Independence mine, Austin, Manhattan company, silver ore; S. M. Beloher & Co., miner's tools; Thomas G. Taylor, Gold Hill, double-deck hoisting machinee. Oregon—Pioneer oil company, Salem, linseed oil; R. C. Kenney & Sons, Selem, flour; Daniel Holton, Portland, veneerings of Oregon maple; Parrish & Miller, Jefferson, flax in the straw and lint; T. L. Davidson, merino wool; Charles Dubois, Portland, furs.

IT seems rather singular that, notwithstanding the great production of silver from our mines, especially in Nevade, our National Government is reported as purchasing silver in large quantities in Europe. This fact seems to have created a distrust in the minds of many Europeans as to the reported productions of our silver mines.

THE tunnel through Treasure hill, which was started by an Eastern company last spring, and which has been lying idle for several months for want of funds, is soon to be worked.

IF you have got a mining claim get a patent for it, and if you don't think it worth patenting, give it to some man that does. A patent to a mine increases its selling value about one-half.

Comstock Papers.

No. 11.

The White & Murphy Ground

Was located by Alexander White and John Murphy, Washoe miners of the ante-Comstock era. Their claim, which covered but 210 feet, now forms a part of the Consolidated Virginia mine. They sold out early, realizing but a few thousand dollars for ground that has since been sold many times over at the rate of more than fifty thousand dollars per foot, or ten million dollars for the whole. Both of these men are now dead, White having died many years ago, and Murphy more recently, both being poor at the time of their decease. Murphy, besides his interest in the above ground, owned at one time 200 feet in the Crown Point and some other locations at and below Gold Hill. But from none of these did he ever receive much money, having disposed of his interests therein before any important developments were made upon them. During the Reese river excitement he migrated to that country, and was there again fortunate in getting into a good claim, having been one of the locators and a fifth owner of the Murphy mine, situated in the Twin River district, 50 miles south of Austin. In 1864 he disposed of his interest in this property for $10,000 cash, after which he made a journey East, but does not appear to have remained there long, as he subsequently turned up among the advance prospectors at White Pine. But here his usual good luck failed to attend him, and he, like thousands of others, was forced to leave the district with a depleted exchequer; nor, speeking in miner's parlance, did he ever again succeed in making a *raise*. Murphy, who was an Irishman by birth, was a man of considerable shrewdness and natural ability, and with better early opportunities and more favorable surroundings would likely have achieved a larger and more permanent success. Being big-hearted and socially inclined, his character was marked by some of the infirmities common to generous natures, such as a disposition to trust to luck and to spend his money freely among his companions and friends.

The Hale & Norcross Claim,

Containing 400 feet on the main lode, was originally taken up by the men whose names it bears; both of whom were living in the country at the time of the Comstock discovery. Hale was an old man and a Mormon, having come from Salt Lake and settled in Washoe valley some eight or nine years before that event. He was about the only one of that sect, many of whom were then living in the valleys of western Utah, lucky enough to secure an interest on the great mother lode by location, though quite a number of "Jack Mormons," a class of Gentiles so called because of the special regard they manifested towards that people, had the good fortune to obtain claims or parts of claims in that manner. After selling out his ground in 1860 the old man returned to the Land of the Saints, where the $2,000 or $3,000 he had brought with him soon found its way into the plethoric purse of the church.

Norcross, who had spent most of his life on the ocean, acting in the capacity of a common seaman, had by some chance current of fortune been carried over the Sierra Nevada, and was, during the summer of 1859, at work in a sawmill standing at the head of Eagle valley. Excepting one idiosyncrasy he was not a man to be specially noticed or remembered—Norcross was one of the most profane persons we ever met with; and we say this not wishing to disparage the well-founded claims of other unusual men to great accomplishments in this direction. We don't say, as is so apt to be said in cases of this kind, that every other word this fellow uttered was an oath, because, in fact, it was not; yet we do affirm that he was noted for his impious and irreverent utterances even among the primitive crop of Washoe miners; and that these latter were by no means a God-fearing or, for that matter, a devil-fearing people, it is needless to allege. He joined Hale in disposing of his claim and soon after left Washoe and came to San Francisco. What became of this son of Neptune, if still alive, we know not; what has become of him, if dead, we know well enough. It is said that after having, sailor-like, spent all his money in fast living, he again betook himself to a seafaring life—a course he would be very apt to pursue on finding his coffers empty and his craft fast drifting on a lee shore.

The ground disposed of by these two men in the summer of '60 for some five or six thousand dollars, is now selling at a valuation of about three million dollars, and has in times past sold at much higher rates, if we deduct the cost of development and permanent improvements since made upon it.

John Bishop,

Who was a Canadian by birth, went to Washoe in '58, mined along Gold canyon and ran much with Sandy Bowers. He owned at one time in Yellow Jacket, Crown Point, and other claims about Gold Hill. He also owned 50 feet, being one-sixth of the California ground now included in the great bonanza mine of that name. He procured all these interests by original location, his name appearing often on the old records of the Gold Hill district. Although he sold out early and at low figures, the amounts received from his various claims aggregated a handsome sum. Being a man of many acquaintances and of social habits, his money went freely; and although an active prospector and good worker, we believe he has met with no special success since he left Washoe; his time of late years having been spent mining in California, or in tours of exploration into more distant parts of the country.

Bishop's name has recently been brought into prominence through its connection with a lawsuit instituted by certain Washoe parties against the present California company for the

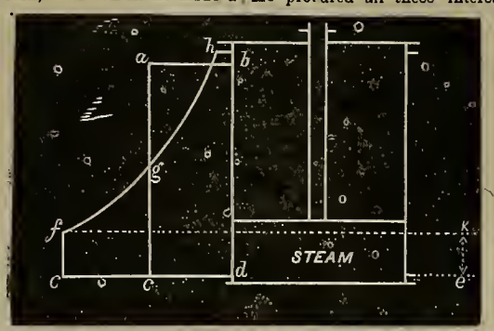

FIG. 1. CORNISH ENGINE THEORY.

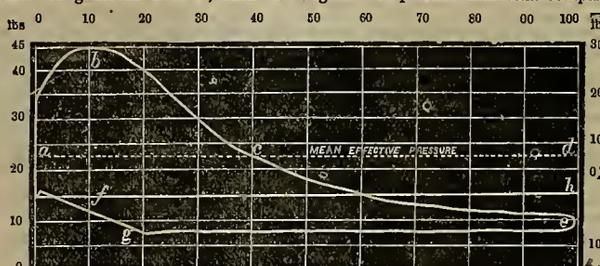

FIG. 2. CARD FROM CORNISH ENGINE.

purpose, as set forth in their complaint, of recovering the 50 feet of ground formerly owned by him, and to which they allege the company have no legal title, the deed purporting to convey it to them, and through which they claim to derive title, being a forgery. As to the merits of the controversy we have, in its present stage, no means of judging, though the plaintiffs stoutly affirm that they can maintain their allegations by ample and incontestable proofs. If this is the case, it is a little singular, to say the least, that a suit for the recovery of this valuable estate should have been postponed to so late a day.

THE ore of the bonanza mines is kept well wet down. An examination of the fine dust which congregates in the ore-house and which is frequently seen blowing from ore in transitu proved it to be chloride assaying $216 per ton. It is an easy thing for enough to be blown from a car-load of dry, rich ore to pay freights. This is saved by simply wetting down the ore.

THE C. & C. shaft has capacity for stowing away 8 000 cords of wood. Trains are kept busily running putting in a winter's supply, which will be but little less than that amount. A large supply of timber is also being laid in.

FIFTEEN Mormon wagons loaded with portions of the ten-stamp mill moved from Bullionville on Wednesday last bound for the Leeds mining district.

The Drainage of the Comstock Lode.

[Written for the PRESS by P. AUG. HUMBERT.—No. 1.]

There is hardly a subject of more importance to persons interested in the mining enterprises on the Comstock lode than the draining of the mines. On the solution of this problem rests in a great measure the prospects for future success in developing the deep workings. Only a few years and we will have attained depths before unknown in the annals of mining; this will necessitate machinery as perfect as that used in any other country, and I feel certain that I am complying with the wishes and interests of most men connected with this mining district by giving them the outlines of the systems now in use and my ideas of what is to be done in the future on the Comstock.

To explain what difficulties are to be conquered before attaining satisfactory results, it is necessary to comprehend how the water occurs in this lode.

Bodies of Water on the Comstock Lode.

Geology shows us that water occurring in slate formations is usually found in constant quantities; that is to say, that the flow is not susceptible of great change. Not so in rocks of crystallized character; here the water occurs in bodies of greater or lesser dimensions, which, after having been drained, give little or no water; that is to say, we have to do with inconstant quantities.

Experience has shown us this law of geology to be correct as regards the Comstock. The flow of water in these mines is of the most varied quantities, liable to be easily handled but also at any moment to come in such quantities as to flood the mines. The problem which is then set to the mechanic is to construct a machine capable of pumping a small as well as a large quantity of water and to be as economical as possible in regard to fuel. As to fuel, it is a question of the utmost importance, both as regards the cost of pumping and the future supply. It cannot be too strongly impressed that each year is making large inroads on the timber of the Sierra Nevada, and that every possible means should be adopted to save the most important agent in working these mines.

Deep Pumping.

The methods employed to pump water at great depths can be arranged in three distinct classes: 1, Pumping with surface engines and usual pit-work; 2, Pumping with underground steam engines; 3, Hydraulic system. We will examine each of these systems and then determine which is best adapted to the Comstock mines.

Pumping with Surface Engines.

The difficulties of pumping at great depths with surface engines and usual pit-work are generally but little understood, and have been totally disregarded in the calculations of the work to be performed by the pumping machinery on the Comstock.

It is well known that to arrive at economy of fuel, expansion must be used in steam engines. The Cornish engines were the first introduced on this principle. We will examine this system and then see why recourse was taken to compound engines. The Cornish engine is single acting; that is to say, the steam is employed on one stroke to raise the rods, and their weight is then used in turn to lift the water on the down stroke.

It is clear from the accompanying diagram, Fig. 1, that if a constant force is used to overcome a constant resistance a parallelogram will be formed, represented by the area, *a*, *b*, c, *d*. That expansion can be used is due to the energy which is stored up in every mass of matter which is put from a state of rest into motion, and that this energy can be used to bring the mass, by expanding itself, back to a state of rest. In the case of the Cornish engine the pit-work is the mass used to acquire this variable resistance, which is equal to the formula: $Wv^2 \div 2g$. In this formula, v, the velocity given to the mass, is the speed of the piston from *e* to *g*, and W is the mass moved. The speed of the piston is a quantity which may be regarded as constant; therefore the required momentum must be derived from the mass, and this mass must increase in a certain ratio to the degree of expansion used.

In the diagram, Fig. 1, the energy stored in the mass would be equal to that part represented by the area c, *e*, *f*, *g*, also equal to the area of energy expended, *a*, *h*, *g*. The mean pressure of *c*, *e*, *f*, *g*, multiplied by c, *g*, and the result multiplied by the area of the piston will give the energy of the mass or momentum. Taking the momentum at 150 foot-tons and the load on the piston at about 50 tons, at a velocity of four feet a second, the mass required would be nearly 600 tons, with an expansion of only four and one-half to one. The water load in Cornish engines used to be about 14 pounds per square inch of the steam piston, now it is about 20 pounds; this decrease of ratio of expansion in these engines is due to the too great wear and tear found to occur in the machinery, by the usage of a high degree of expansion. The best Cornish engines cut off steam at one-fifth of the stroke, but very generally expansions of one-third and one-half are used.

If the Cornish engine were made double acting the mass would have to be increased beyond practical limits, or very great reduction in the expansion would be required, necessitating a great waste of fuel; to use expansion to a high degree and to acquire as constant a force as pos-

sible during the stroke, leads us to expansion in two cylinders or compound engines.

To show the necessity of the usage of expansion, it may be stated that Henry Davey, of Leeds, England, writes in his treatise on the "Differential Compound Engine:" "Our steam engines consume annually 37,000,000 tons of coal, which at present (1875,) may, perhaps, be reckoned at 15 shillings per ton, representing over £27,000,000 sterling; an economy of 25 per cent. would, therefore, effect a saving of nearly £7,000,000 annually. With colliery pumping engines it is not unusual to find a consumption of from 12 to 14 pounds of coal per horse power per hour. A good compound engine will work with less than one-fourth of that amount of fuel. The saving to be effected on 400-horse power of actual work, by the substitution of a compound for a non-expansive engine would be, at the lowest estimate, 36 tons in 24 hours, which, taken at five shillings per ton at the pit's mouth, would amount to the modest sum of £2,700 per annum."

Taking Davey's estimate as a basis of calculation, and putting a cord of wood at $12 and 60

Inward stroke, light load. Cut-off, 47 per cent.

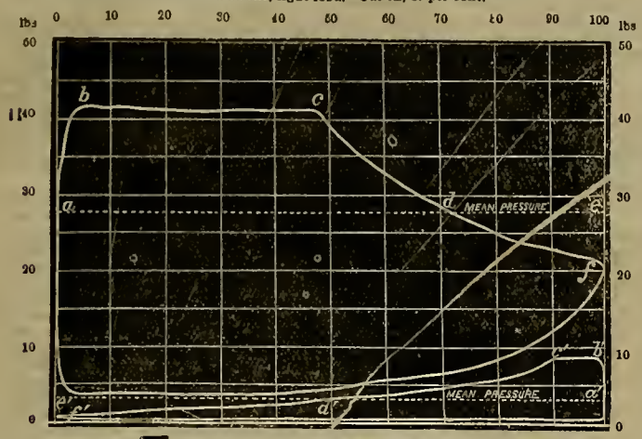

FIG. 3. CARD FROM THE DAVEY ENGINE.

High pressure cylinder, mean pressure, 27.8 pounds; low pressure cylinder, mean pressure, 3.4 pounds. High pressure = 60-horse power; low pressure = 18.8-horse power; total of both cylinders, 78.8-horse power.

per cent. of the best English coal as determined by experiments, a saving of $217,728 on 400-horse power of actual work would be arrived at between a non-expansive and a compound engine on the Comstock.

Having shown the economy of expansion, we will return to the advantages of working the compound engines as compared to those expanding in one cylinder.

We have seen that the Cornish engine cannot be economically applied to double action, and that as single acting it is a system of pumping which is subject to great wear and tear; further, it may be stated that the engine, being single acting, is very expensive in first cost. All these objections are, in a great measure, removed by the compound double-acting engine.

In a compound engine, by the usage of two

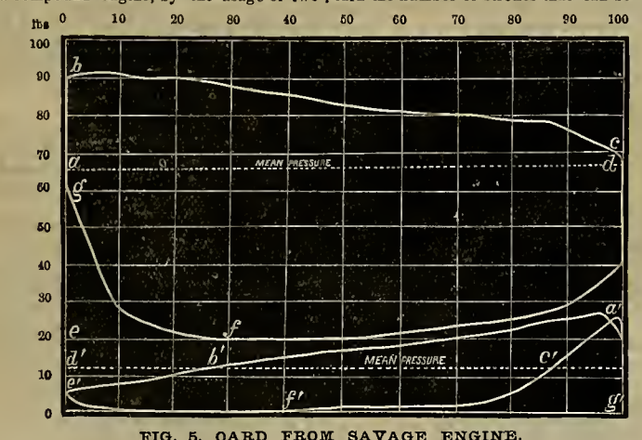

FIG. 5. CARD FROM SAVAGE ENGINE.

Outward stroke.—High pressure cylinder, mean pressure, 65.1 pounds; low pressure cylinder, mean pressure, 12.5. High pressure = 42-horse power; low pressure = 25½-horse power. Total outward stroke, 67½-horse power.

cylinders of different volumes, the steam works first in the small cylinder and expands then in a larger, working, therefore, with its reduced pressure on a larger area; the relative volume of these cylinders regulates the minimum expansion given to the steam. This naturally decreases the maximal strain on the piston and on all working parts.

It has been proven by diagrams that, on a compound engine expanding ten to one, a reduction of two and one-half to one need not be surpassed between the initial and terminal pressures in either cylinder, while with a single cylinder the proportion would be ten to one. This universally admitted fact shows that the momentum of the mass moved is, in this case, of no advantage and will only reduce the speed of the engine in starting and stopping it.

The pit-work should be made as light as possible, and every means should be employed to reduce the mass.

A suggestion may here be made regarding the pit-work on the Comstock, that is, the usage of iron pump rods, which, by lessening the mass would allow the engine to work at greater speed. These rods would not be more expensive than wooden ones, would weigh about one-half the column of water, balancing the engine, and be more durable where the waters are unt such as to eat iron too quickly. They are universally adopted in Europe for double acting engines.

Speed of Direct Acting Engines.

It has been already remarked that in the case of double acting engines on the compound principle, momentum of the working parts is not required, but in deep shafts the rods and balance bobs give a momentum which has to be stopped; it is the starting and stopping of this mass which limits the strokes of the pumping engines and consequently the speed of the piston. This limit of the speed is a serious objection and a difficulty which augments with depth.

To make a compound engine work correctly, that is to say, to acquire initial and terminal pressures nearly equal, no momentum should exist, consequently the formula, $Wv^2 \div 2g$, should equal zero; if we solve this equation to find v in this case we would have: v equals the square root of $2g \div W$, or, expressed in other words, W, the weight of rods, etc., being an augmenting quantity as depth is attained, the speed of the mass must decrease and with it the speed of the engine.

It will be found by calculations that a 20-inch pump, twice the size of a 14, will not throw double as much water, giving it the same stroke, on account of the increased mass. To remedy in part this difficulty with direct acting engines, the stroke of the engine should augment as depth is attained, but this increase of stroke is almost beyond practical limits, and leads to very costly machinery.

The number of times that a certain mass at a certain velocity can be started and stopped in one minute is a limited quantity, limiting in turn the number of strokes that can be accomplished, and consequently the water that can be pumped by the engine; by increasing the stroke a greater number of feet of piston speed can be arrived at, because the mass has to be started and stopped less times in a minute, and gives a greater distance to applying the power, consequently the delivery of water will be greater. This momentum, which is a given quantity, must be stopped if the engine is to work correctly by expansion, and leads us back to the Cornish engine theory, taking part of the benefit from the compound engines, that is to say, making the initial and terminal pressures of steam in the cylinders more unequal. Very generally on the Comstock, a cushion of steam is used to stop the energy, but this is decidedly injurious to the machinery by the mass playing on the cushion, creating a spring and jar through the whole pit-work. It is only to be used in urgent necessity, as an agent to increase the number of strokes. Being a loss of power, it will be found to increase the consumption of fuel by reducing the expansion. It results from these remarks that an engine working correctly should augment its expansion as depth is gained and reduce, as has been remarked, its piston speed or increase its stroke.

The increase of the stroke being variable, would necessitate new pumping machinery, and is a very serious consideration. On the Comstock, depths are just being attained when these defects will begin to show themselves more forcibly than heretofore.

The geared engines, which are more generally used on the Comstock than in any other mining country, have the same trouble of the momentum, only it is not so forcibly shown as in direct acting engines. Here the mass put in motion has to be stopped by the gear; the crystallization of the shafts, the breaks which occur so often, can be traced to no other reason than the sudden stoppage of the energy imparted to the pit-work during the stroke of the pumps. It is true a greater number of strokes can be attained, but at a heavy cost to the machinery as well as to the working of the mine, by stoppages just when the waters are heaviest and most likely to flood the workings.

Outward stroke, heavy load. Cut-off, 60 per cent.

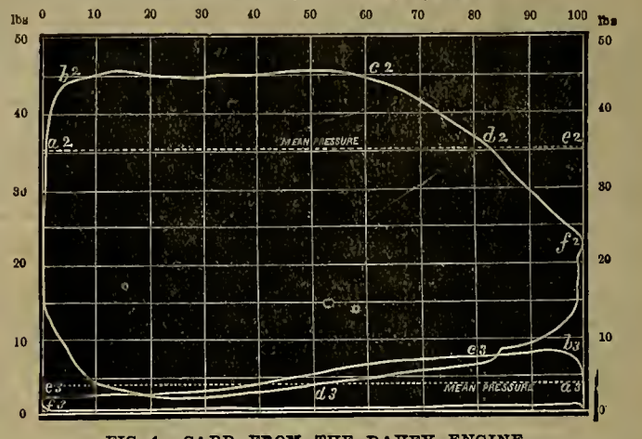

FIG. 4. CARD FROM THE DAVEY ENGINE.

High pressure cylinder, mean pressure, 35.2 pounds; low pressure cylinder, mean pressure, 25.4 pounds. High pressure = 76.2-horse power; low pressure = 25.4-horse power; total power, 101.6-horse power; total power of the engine, 180.4-horse power.

It will be found that on the present engines on the compound direct acting principle, working on the Comstock, by 1600 feet depth and 14-in. pumps, about 50 feet of pump speed cannot be overrun when the engine works with expansion and safety; with cushion and at 1558 feet depth, a velocity of 104 feet per minute of piston speed has been attained, the engine working without safety. This decrease of speed is to be considered a great drawback to pumping with surface engines and usual pit-work, and as it will increase with depth, the limit is not far distant when surface engines with usual pit-work will not be adequate to drain these mines with safety or economy.

Before leaving the question we will examine diagrams taken from a Cornish engine and a compound engine, by Mr. Henry Davey, and the expansion between the two strokes is 27 per cent. The variation on the inward stroke averages between the two cylinders for initial and terminal pressures, as 5:1; while the theoretical expansion is as 6¼:1; this is due to the fact of the condensation, which takes place from the exhaust of the high pressure cylinder into the low pressure, but is actually no loss to the engine as it exists also in the single cylinder engine, only is not shown by the indicator.

It will be easily seen

By These Cards

How much more constant the force is here than in the Cornish engine. With these diagrams the lifts are not mentioned; we will, therefore, compare the diagrams of the Savage with those of the

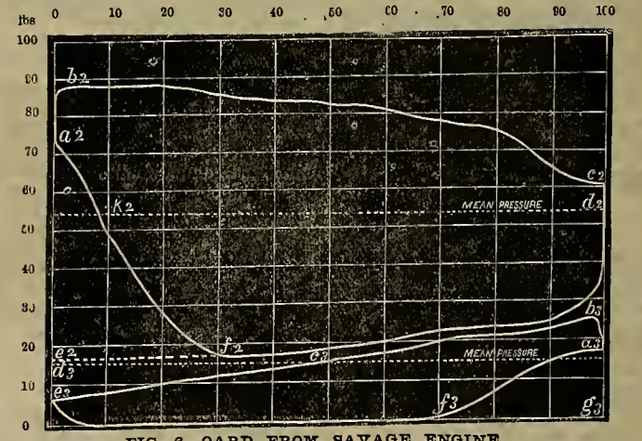

FIG. 6. CARD FROM SAVAGE ENGINE.

Inward stroke.—High pressure cylinder, mean pressure = 62.3-pounds; low pressure cylinder, mean pressure = 13.1 pounds. High pressure, 32.8-horse power; low pressure = 26-horse power. Total of inward stroke, 58.8-horse power. Total horse power of engine, 1262-15.

also the diagrams taken from the Savage, working with cushion, and the Alta, using expansion to bring the mass to rest; these will more clearly show the difference of the working of these engines under these circumstances.

Fig. 2 is an indicator diagram from Cornish pumping engine at Grenver & Wheal Abraham mine, Cornwall. Cylinder, 90-inch diameter, 11-foot stroke. Mean effective pressure, 13.8 pounds.

It may be remarked that f, g shows in the diagram a vacuum cushion; this closing on the down stroke the exhaust to the condenser, is simply to bring the heavy mass to a rest and is required in a single acting engine; it is no loss of power. The figure a, c, d, h, f is the actual water pressure on the steam piston, equal in this case to 13.8 pounds; the part of the diagram a, b, c above the mean effective pressure line is the energy stored in the pit-work, and the figure d, c, e is the force represented by the energy expending itself. It may also be remarked that the variation of initial to terminal pressures are here as five to one, consequently showing

Alta, but only as regards the stopping of the energy of the mass.

Figs. 5 and 6 represent the diagrams of the Savage engine; diameter of the high pressure cylinder 27″; diameter of the low pressure cylinder 48″; stroke, eight feet. At the time the the diagrams were taken the engine was making four and one-half strokes per minute (double), with 1,558 feet water column; non-condensing engine.

From Figs. 5 and 6 it is at once quite clear that in Fig. 5, a, b, c, d minus the back pressure of diagram, Fig. 6, supposing it to run to e^2, would be the energy of the mass and is stopped by the figure a^2, f^2, e^2; the same is to be taken for the low pressure cylinder and for the diagrams of Fig. 6. It is shown by these figures that expansion is scarcely used, and that the power is expended to create the cushion; the benefit that is derived from the cushion on the next stroke is very small, and at all events it is a mistake not to use the energy of the mass to create expansion, for with it would be reduced the consumption of fuel.

American Mines.

The subjoined article is from the London *Mining Journal* of October 28th of this yeer. It waa furnished the *Mining Journal* by a member of the firm of F. W. Munsell & Co., London, stock brokers, who was here in company with one of the editors of the *Mining Journal* a few months ago. Our readers will notice that it is but a preliminary article, and we presume will be followed by a series of communications which will tend to set the minds of Englishmen right in regard to our mines—something which heretofore it has seemed impossible to do. We shall look with interest for succeeding articles. The one in question from the *Journal* is as follows:

Accompenied by reputable experts during a three months' tour in the mining centers from Selt Lake City to San Francisco, we have ecquired a mass of information not to be otherwise obteined. We are indebted to Mr. John Mackay, "the honanza king" (to whom we were introduced hy Mr. P. McKay, of the Benk of California), for en inspection of Consolidated Virginia, the most productive of the Comstock group, and the richest mine in the world. So extensive is the scale of operations, so unparalleled the gulf of wealth, and so almost automatic the manipuletion of the ore from the time it leaves the huge excevetions till reduced into gold and silver bers, thet one feels to be well repeid for a journey from the old to the new world by a visit alone to thia truly mervelous treasure house, yielding as it does, a monthly dividend of $1,080,000 (£216,000). We propose to fully describe these mines in subsequent notices. In our examination of the prominent mines of Scandinevian canyon, Silver Mountain (inclnding Exchequer, L. X. L., Isabelle, etc.), we were aided by Mr. Chalmers and several other well-known authorities, some of whom had gained their experience in the Comstock mines. At Eureka, Mr. Probert, maneging director of the Richmond Consolidated mines, received us most courteously. We accepted his invitetion to inspect the mine, and had the edvantege of his personal assistance throughout a protracted exmination of the ore body at the different points of operetion. A second day wes employed in visiting the smelting works. At Gress Valley, California, we hed the privilege of inspecting the underground workings of the Idaho, the representative end richest gold quartz mine in the Golden Stete. This mine in 1870 wes offered in the London market for $100,000 (£20,000), since which it has returned in dividends, $1,300,000 (£260,000), is producing more and richer quartz then at any previous time, has larger reserves, apert from the faot that the vein hes just been cut rich in the 900-ft level, end the stock is selling at a high premium upon the San Francisco stock board. In our visit to the hydraulic gold mines we were accompanied by Professor Price and other experts, from whom much guiding knowledge wes gained. To Mr. Hughes, resident manager of the Blue Tent, and to Mr. Powers, of Birdseye creek, no less than to Mr. Bowe, a locel director, we owe our thenks for the painstaking manner in which they pointed out, with no small amount of lebor, the merits and capebilities of the reapective mines. While in Selt Leke district many fects were gleaned concerning Flagstaff, Emma, and other mines in the locality. Unpardoneble on our part would it be not to avail ourselves of this opportunity to acknowledge the friendliness with which we were received throughout the whole of the mining camps west of the Rocky mountains, and the business relations we have succeeded in establishing will place us in poasession of informetion usefnl to English investors.

Butte County Mines.

As the rainy seeson comes on, seys the Oroville *Mercury*, we heer the notes of preparetion for mining on every side. A great deal of gold wes teken out of the foothills, ravines and river-benks last season, but if we should he blessed with a wet winter the coming season a great deal more will be brought to light. In addition to the greet cleime that have been worked for a number of years, a large number of persons have sterted out to work in a small wey, in the hope of being successful. In fact, almost every one who ever followed the business et all, is now on the lookont for a new plece. Just ecross the river O. P. Powers has had 100 men at work for a long time cleaning out, deepeniug end widening the ditches, so as to admit of some 2,000 or 2,500 inches of weter runniug during all the wet seasou and es much as they cen get during the belance of the year. He has mede preparetion for five chiels to operate on the benk of loose grevel. This will wash away a large piece of ground during the winter. The claim cost them $50,000 about a year ago, and last winter, with a single chief and but little water, they took out over $13,000. This eeason, with five chiefs, they expect to more than treble thet eum. At Morris ravine, the Hendricke claim, said to be one of the richest in the whole State, has been put in a capital condition for working, and the returns from it will no doubt he correspondingly large. There is no part of this ravine thet is not rich. Very many valuable claims are now so situeted that it will be imposeible te work them on account of the want of water, but they lose nothing by being idle. Each year they increase in value as the surrounding claims yield up their golden harvests.

A quartz ledge that prospects well hae been fonud in the ravine and three araetraa have been built and are now ready for work. The Spring Valley company's claims at Cherokee still continne to send forth their golden fruit. Every month the company sends down from forty to seventy thousand dollars' worth of gold end will continue to do so for yeers to come. Further up the hills is the claim of E. J. Davis, thet hes been worked just enough to get it well opened, and to prove that it is rich. He has had between two and three hundred Chinamen at work digging a ditch to bring water to the cleim from the West branch. The underteking was one that cost about $30,000, yet it had to be done in order to work the mine except dnring the very wettest pert of the year. When once the claim is reeched, it can be worked during the entire year. We are not informed es to the time when the work will be completed, but hear thet it will be aome time before the close of the year. The Electric mine is doing well, having found a body of ore thet pays well. The new tunnel will open up a body that will last for a long time. The little mill with the Panl process is doing excellent work. At Forbestown the company is now working in rich rock. During the past summer they have been at work developing their ledges, so that when the mill started again there should be no leck of rock. On the Isebenda claim, near Dogtown, about one hundred men are at work digging a large ditch that shall be used to work a lerge area of grevel below that place. These ere by no meana the only pieces of work that ere being cerried on, nor are they the helf. Mining never before assumed the proportions that it does at the present day in this country. Capital is looking this way, and the rich fields that are being opened up give promises that it hes not mistaken the proper place for investment.

Mariposa Tunnel and Work.

On Wednesday last, seys the Meriposa *Gazette*, we mede a flying visit to Bear Valley and the Bentou Mill tnnuel of the Mariposa land end mining company. The distance from Bear Valley to the mouth of the tunnel by the wagon roed is about six miles, four miles of which passes over the track formerly used es e railroad in cerrying ore from the Pine Tree end Josephine mines, on the Merced river, near the adit of the tunnel end present works of the compeny. To e casual observer, it would scarcely be believed that auch an excellent wagon road could be built over so rugged a country as this locality presents at first view. The grede is easy end the road iu such fine condition thet with a two-horse vehicle, the descent to the river end beck againu to the Pine Tree end Josephine mines (which is the top of the mountaiu dividing the river from Beer velley), can be driven over with as much ease and rapidity as mostany other road of the same length in the county. This road is a greet convenience to the company, who now have their heavy mechinery brought to its destinetion by the large freight teams, thereby avoiding deley as formerly, in unloading from the wegon and reloading on board the cars, which wes attended with a great amount of labor and expense. We observed at the works and mills a lerge emount of new mecuinery, intended for a quartz crushing mill, the foundation of which is in course of construction, upon which the mill is to be erected es soon as precticable. Thet which most engages the company's attention at present is the new No. 7 compressor, seid to be one of the largest ever built, and is elready upon the ground. The mechinist and mechanics, employed for the purpose, are rapidly constructing the frame work, which is to receive the new compressor, one of the most useful improvements in machinery of this ege of discoveries end inventions. It is expected that in less time than three weeks the new compressor with all its adjuncts will be in full blest. The tunnel is now into the mountain about 2,300 feet, and it is anticipated thet by means of the new compressor from 12 to 16 feet per day will be excavated, whereas, heretofore the excavation of from four to eight leet hes only been the everege rete per day. There are quite a number of tona of ore upon the dump, teken out of veins crossed by running the tunnel, most of which is considered good pay rock.

You Bet.

The name of this proeperous mining camp is as familiar to the ear of the California miner es any of the numerous mining camps that sent down their tributes of gold to the see, end although now greetly reduced in size and population to what it wes in those good old days, it still remains a thriving little town, you bet. It hes had the misfortune of being entirely consumed by fire four times, and still it can boast of the following business houses, all of which are doing a good paying business: One hotel, two stores, two saloons, butcher shop, shoemaker shop, and postoffice. The Odd Fellows have a handsome and spacious hall. There are quite a number of nice family reeideuces in and about the town. The canyons and gulches in this vicinity, that were once worked in early days by the numerous miners, are now occupied by flumes and undercurrents, belong to the extensive hydraulic mines owned by A. Hayward and an English company. At present they are worked on a large scale, but it will take years to exhaust the mining ground. These mines give employment to a large number of miners, who generally make Mr. Drunzer's hotel their headquarters, passing an hour or two each day in the saloone, reading the papers, talking politics, and playing bean poker, and a more liberal and sociable lot of men we have never met in the State.—*Dutch Flat Forum.*

Reaping the Reward of their Labor.

The Nevade *Transcript* conteins the following: Now that the success of the Cold Spring gravel mining compeny is assured, and it will soon be classed es e paying mine, we propose to give a few facts showing the difficulties the compeny hed to encounter, and the perseverance with which they prosecuted their work.

The mine has been worked, more or less, for the past ten years; but steedy work was not commenced till 1874, when en incline wes run from the surface, a distence of 400 feet. From the bottom of the incline a chute of 132 feet was reised to strike the gravel. Finding they had not reached the chennel, they went back to the bottom of the incline, and commenced a tunuel towards the center of the ridge, which wes run a distence of 318 feet, through herd blesting rock. Again they raised up a chute a distance of 100 feet, when they struck pay grevel, but were not on the regular channel. From the top of the chute a drift was run north 85 feet, end in that direction the bedrock raised one foot in ten, but having a pitch to the west. They ceme beck to the top of the chute end ren another drift west, 50 feet, at which point the bedrock was pitching west and south. It was then determined to come back to the bottom of the main tunnel, where the bedrock wes soft, and run a chute in a westerly direction, thinking to strike the leed et its lowest point; but insteed atruck a high peak, the grevel being struck at a perpendicular hight of 78 feet, the bedrock pitching west rapidly, giving the helief thet the chennel was still west. Going back 40 feet in the seme chute, they run a drift in a northwest course, and at a distance of 132 feet struck pay gravel in the top of the drift, showing the rapidity of the pitch of the ground.

During the pest two months drifts have been run in various directions, prospecting the gravel end trying to find en inlet to the mein chennel. Not finding the object of their search, although having good pay dirt, they went back to the same chute to a place where the bedrock wes more demp than anywhere else, and raised enother chute running north. Nine sets of timbers had been put in, when gravel was struck at a perpendicnlar hight of 46 feet above the mein channel, pitching uorth. From prospecting since mede, it ia believed to be a ravine leeding to the ancient river chennel. Prospects of grevel which heve lately been made, show it to be increasing in richness ea they proceed north. Forty, fifty, sixty and seventy cents to the pan cen now readily be obtained. A number of pens of dirt from the dnmp-pile have been washed, which yield on an average twelve cents to the pan. Arrangements are now being made to work the claim in a systematic way, breasting out the gravel the entire width of the ravine or sag, end thus uneerth the golden treasure which lies imbedded under the ridge. The company will now commence to reap the reword of their industry, and good returns will be mede from the gravel which is now being teken ont, and when the main channel is reached, which cannot be far off, we believe, and with good reason too, thet the seme success will greet the owners of the Cold Spring as did the owners of the Live Oek, Young America, and Nebreske, in the palmy days of our city's early history.

Bartlett Creek.

Messrs. Merrill & Williams, two sturdy prospectors of the Bartlett creek region, errived in town yesterday. They report the mining interests of thet section as very encouraging. Miners in end around Varyville ere busy preparing for winter. Mr. Merrill brought in severel specimens of ore from ledges discovered by him the past aeaeon, which he is now having assayed at the Humboldt reduction works. The Highland mine, owned by Merrill, Mecy, Williams and others, situated neer Snow creek, and about aeven miles from Veryville, is looking exceedingly well. They have aunk about 12 feet on the vein, which, as much of it as can be aeen, fairly sperkles with gold. The vein avereges 10 inches in width. Five tone of ore from thie mine, worked at Denio's mill at Varyville, turned out fifty odd dollare to the ton in gold, end two and a helf tons, worked in the seme mill, turned out $140 to the ton. The company ere negotiating for the erection of a mill neer the mine. Within one mile of the miue a good water power can be had with but little labor.—*Silver State.*

A New Steamer for Lake Tahoe.—The latest eddition to the steam fleet on Lake Tehoe ie the iron steem yacht *Meteor*, built at a cost of nearly $16,000. She is owned by D. L. Bliss, of Cerson, end D. O. Mills, of San Francisco. Their euticipations of heving the faetest boat on thie side of the continent have been fully reelized, and visitore to the lake will be enabled to eteam aronud it in lees than six hours; a trip which hae heretofore taken at least 12 hours. The hull is compoeed of iron weighing hut eight tons, her frames being 1¼ by 1¼-inch angle iron, and plating one-eighth inch thick. Her length over all is 80 feet; on water-line 75 feet; beam at water-line 9½ feet. Her engines consist of two 10-inch cylinders with 12 inch stroke. The boiler is of steel, teeted to carry 200 pounde of steam. The propeller ie 54 inches in diameter and 7¼ feet mean pitch. With 330 revolutions on 155 pounde of steam the *Meteor* makes 20 statute miles per hour. The model was designed by E. J. Auderson, architect of the *Three Brothers*, while the engines and boiler were designed and built by W. R. Eckart.

Accidents in Mines.

Since 1869, says *Engineering*, accidents in mines involving loss of life in Prussia have to be entered by the mining authorities on special forms, which are sent in at the end of the year to the statistical office at Berlin. Here the materials are worked into a summery, conteining the respective occupetion of those killed, classing the accidents according to their severity, and grouping them in accordence with their causes. The summaries for 1874 end 1875 show that in the former yesr, 589, and in 1875, 576 persons lost their lives in Prussian mines, of which 572 and 573 respectively were overtaken by deeth while actuelly at work. Of the letter number, the following were killed in—

	1874.	1875.
Coal mines	484	436
Brown coal mines	36	42
Ore mines	36	82
Other mineral-producing occupations	16	11

To judge correctly the importance of those figures it is necessary to know the number of persons employed in each branch, which, up to the present time, are known only for the yeer 1874. In thet yeer the average number employed in coel mines wes 162,502; in brown coal minea, 18,646; in ore mines, 58,822; and in other mineral producing branches, 872 persons. Thua, the number of killed in 1874, per thousand, wes 2 99 iu coal mines, 1.93 in brown coel mines, 0 61 in ore mines, end 1.83 in other mineral producing occupetions.

It is not uninteresting to compare the figures of the loss of life in Prussien mines with that in English mines, on which the reports of the inspectors of minea give yearly full informetion. Unfortunately, the comparison between the English and Prussian reports is only of a very restricted netnre. In the English reports the grouping observed is not the seme as in the Prussien stetistics; coal, ironstone, cley, and coal-slate minea, in accordance with the coel mines reguletion act, being combined in one group; the other group, of still greater importance, and comprising, besides iron lead, and tin miuing, being snbject to the metalliferous mines regnlation act. In the 4,501 mines affected by the first named ect, 1,056 persons lost their lives in 1874 end 1,244 in 1875, while in the mines reguleted by the metalliferous mines act, 103 persons were killed in 1874 and 119 in 1875. The numbar of persons employed in coal, ironstone, clay and coel slate mines was 538,829 in 1874 and 535,845 in 1875, and in the remainiug mines 56,361 in 1874 and 58,073 in 1875. Of 1,000 persons employed in the first group of mining operations, therefore, 1.96 were killed in 1874 and 2.32 in 1875, while in the second group 1.83 in 1874 and 2.05 in 1875, lost their lives.

In the English mines under the operetion of the coal mines regulation act, 140,713,832 tons were raised in 1874, end 147,700,313 tons in 1875, so that there was one person killed in 1874 to every 133,251 tone (2,665,020 Prussian cwt.) of coels reised, and in 1875 to every 118,730 tons (2,374,600 cwt). In Prnasia, however, one person was killed for every 1,319,780 cwt. raised, of the value of £34,856 from coal mines; 4,842,583 cwt., of the velne of £43,705, from brown coal mines; 1,952,086 cwt., of the value of £81,572, from ore mines; and 285,766 cwt., of the value of £6,245, in other mineral-producing pursuits.

California Clay.

The following letter in regard to the quality of California Clay and the fictile uses to which they can be put, will prove interesting to many of our readers:

Sacramento.

J. B. Owens—

Dear Sir:—Your note of inquiry in regard to California clays, and its quality, etc., is at hand. In the manufacture of sewer pipe I use a plastic clay which, under the action of heat, forms a perfect vitrified body. In its manufacture I formerly used salt as a glaze, which is cheaper and requires less lebor, but I have now edopted the slip glaze, which I believe to be preferable. It is not the degree of heat, nor the use of salt nor slip, as many suppose, that makes the quality of pipe, but the quality of pipe alone depends on the quality of your clay. If your clay will form a vitrified body under the action of heat, glazing adds nothing to the quality, except to fill up the pores and make the surface smoother. If, in the manufacture of pipe, you use strictly fire clay, and use salt as a glaze, the action of the salt has a tendency to harden the surface, but on breaking the pipe you find it has taken no action at all to vitrify the body, hut acts alone on the surface, which is positive proof that the quality of your pipe depends on the quality of your clay. As to a comparison between iron stone pipe and cement pipe for sewerage purposes, it seems to be a point so well settled in favor of stone pipe by engineers of prominence, both in the Eastern and Western cities, that it is scarcely worth while to revert to the matter. You need not have any fears as to our suffering from the agitation of the qualities of pipe. I have been thirty-five years in the manufacture of clays, fourteen years of that time in California, eight years of that time in making and laying pipe, and I have yet to hear one word of complaint in regard to pipe. You can very easily settle any points in regard to pipe—to find its resistance pressure, place it under the force pump and apply your power; to test its durability, place broken pieces in sulphuric acid, and let it remain for three to four months.

Yours truly, N. Clark.

DEWEY & CO.

American & Foreign Patent Agents

OFFICE, 224 SANSOME STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditionsly; Patent reissnes taken ont; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grent Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russie, Spain, Britisb India, Saxony, Britisb Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brszil, Baveria, Holland, Denmark, Itely, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmenia, Brszil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications sbould be prepared with thoroughness, by ehle persons who are familiar with the requirements and changes of foreign petent laws—agents who are reliable and permanently estsblished.

Our schedule prices for obtsining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have fall records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specificetions from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great peins to preserve secrecy in all confidential matters, and applicants for petents can rest assnred that their communications and business transactions will be held strictly confidential by us. Circulers free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a pstent. We are always free to advise applicsnts of any knowledge we heve of previous applicents which will interfere with their obtaining a patent.

We invite the ecqnaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regerd to their rights as assignees of patents or purchasers of pstented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individnal inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and setisfactory illustrations of inventions and machinery, for newspaper, hook, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable iscoveries into practical and profitable nse.

DEWEY & CO.,

United States and Foreign Patent Agents, publishers Mining and Scientific Press and the Pacific Rural Press, 224 Sansome St., S. F.

Mining and Scientific Press,

Is the leading mining journal in America, and enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast, it is decidedly popular and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivalled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, $4 a year, in advance. Sample copies post paid, 10 cents. As an

STRONG & CO.,

ASSAYERS and METALLURGISTS,

10 STEVENSON STREET, S. F.

PAUL'S DRY PROCESS.

I am now prepared to test gold and silver milling ores in any quantity from TEN POUNDS to FIFTY TONS, and assert my ability to prove, by machinery NOW UP, and open to public inspection, and by practical testing of its merits, that I can increase the yield of gold mills, working wet batteries and copper plates, from FIFTY to ONE HUNDRED PER CENT., and on silver ores a much larger percentage than by pan amalgamation, and at less expense than any known method of working quartz well; and from some "gold" ores of California can extract more silver extra with the gold, which is now lost, than all the expenses of mining and milling. Having had 25 years' practical experience in milling gold and silver ores, I presume to know whereof I speak, and AM PREPARED TO PROVE ALL I ASSERT. These mills, for simplicity, cheapness practicability and perfection in working, challenge the skill of the age to surpass. Quartz miners who desire to investigate and have their ore tested, are invited to a critical examination of the machinery and process, and can receive permits for examination, particulars and pamphlets explaining process by calling at my office. ALMARIN B. PAUL.

Room 20, Safe Deposit Building, 328 Montgomery St

ERICH G. GAERTNER,

MINING ENGINEER.

All classes of mining properties reported on, consultations had on reduction of ores of all descriptions, plans for furnaces and reduction works furnished, and the construction of them superintended. Ore tests made at the office,

309 California street, Rooms 8 and 9.

Continued from Page 381.

COSMOPOLITAN.—The daily yield of ore continues to be about 10 tons. The face of the north drift from the bottom of the winze below the main adit level is in low grade ore. The north drift is in excellent ore.

CHOLLAR-POTOSI.—Daily yield, 100 tons of ore. This ore is crushed as fast as extracted, and yields but a small profit over and above the present cost of milling.

SAVAGE.—The pumps are kept steadily running, and the water is being gradually but surely lowered. It is now reduced to a point 20 feet below the 1900-ft level.

MEXICAN.—The west drift on the 1655-ft level is making favorable progress, with excellent prospects of good ore developments.

GOULD & CURRY.—The erection of the new pumping engine and other machinery is making excellent progress.

CALEDONIA.—Sinking the shaft is going ahead as rapidly as the hard nature of the ground and the steady, strong flow of water will permit.

SOUTH COMSTOCK.—The east cross-cut at the 300-ft level is now in 110 feet. The face shows very good little feeders of quartz, giving low assays, and some seepage of water coming in shows proximity to the vein.

UTAH.—Sinking the main shaft is being pushed ahead with the usual energy, the bottom in hard rock.

KOSSUTH.—The ore developments on the 600-ft level are steadily improving, and the appearances are that the Kossuth will soon rank as a first-class producing mine.

SUCCOR.—The new pumping machinery is about ready to start up.

BEST & BELCHER.—Cross-cuts have been started on the 1700 ft level to cut and prospect the ore vein at that point. The heat in the main drift and at these cross-cuts is intense.

NEW YORK.—The enlargement of the pump shaft is being pressed to completion with all the speed possible.

HERALD.—The incline below the 200-ft level continues to develop a fine character of quartz and rich ore.

LADY BRYAN.—The foundations are completed, the hoisting works finished and the erection of machinery commenced.

MINT.—Sinking the shaft is being pushed forward with great energy. The bottom of the shaft is still in soft ledge material of a favorable character.

SUTRO TUNNEL.—Total length of tunnel this morning, 14,211 feet. The face of the header continues in hard porphyry, with small seams of quartz and clay. No increase of water.

NORTH CARSON.—Bottom of shaft in splendid vein matter, with streaks of good ore.

WEST BELCHER.—At the 300-ft level the ore body is coming fully up to the most sanguine estimates in both quality and quantity.

ALTA.—Sinking the shaft is making excellent headway. The pumps continue to handle the water with ease.

Idaho.

THE MINES.—Owyhee *Avalanche*, Dec. 2: For several weeks during the season a limited number of workmen at the Oro Fino took out a considerable quantity of rock, 56 tons of which were recently crushed at the Ellmore mill. It yielded over $36.50 to the ton, realizing a net total for the crushing of $2,062. This is a tolerably good showing. It makes it certain that judicious work and systematic development only are needed to place the Oro Fino on a good paying basis. The company suspended operations about a year ago and made a great mistake in so doing, especially when it is taken into consideration that they had erected costly works and made all preparations for taking out rock on an extensive scale. Such a drawback as that which characterized the management of the Oro Fino is similar to many other discouraging movements which we have witnessed in this camp for the past 18 months. They have been ill-advised and the camp is now reaping the fruits of such action in a partial suspension of business and the prospect of a most exceedingly dull winter. We hope if the companies do not deem it prudent to resume operations, they will allow the mines to be worked for a brief season at least, by private enterprise. There is not a mine on War Eagle mountain to-day but would pay the owners handsomely if judiciously and economically worked. The new quartz mill of Messrs. Jones & Adams, at Wagontown, has just been completed. This marks a new era in the history of that camp and all who are interested in mines there may now reasonably entertain a hope of having good returns from their claims. The mill works like a charm. We have most favorable reports from all the mines in that camp, which promises to be one of the most lively spots in Idaho before long. The prospects of the Golden Chariot were never better than at this moment. It is expected that the force of workmen will be increased soon and operations carried on on a larger scale. The Belle Peck and Potosi mines are looking first-rate. Some rich rock has been taken from the Ellmore recently. It is reported to go fully $200 to the ton. The Empire rock recently crushed turned out very well. Arrangements have been made to work a limited force at the Silver Cord mine this winter.

Montana.

THE YOUNG AND ROUDEBUSH MILL.—Butte *Miner*, Dec. 2: Desirous of learning something positive in relation to progress of work, and how soon it was expected to have this mill in operation, we took a tramp out to the works last week. The site is about three miles northwest of Butte, on what is known as Gimlet gulch. We found matters pretty well along, and if the weather holds favorable it is expected to have the mill in operation in three weeks. It is proper to state that, considering the work done, matters have progressed as rapidly as could be expected since operations first commenced. With the exception of the boiler and engine, stamps and dies, everything connected with the construction of the building, battery, pans and settlers, has been done on the ground. The work has gone forward under the superintendence of Mr. R. C. KNOX, and is being well done. The construction and arrangement of the entire works are very compact, and for economy in space and saving of labor when in operation, this mill will be a model. It is an eight-stamp battery, wet crushing process, and will start with one Purvine pan and one settler. It is their intention, however, to add another pan in time, as the one will not have sufficient capacity to handle the pulp from the eight stamps. The power is furnished by a locomotive engine, of 10-horse power. It is rather light, but to give the engine all the advantage possible, it is geared to run up to something over 200 revolutions per minute, which will drop the stamps at about 90. Messrs. Young & Roudebush now have a small force of men at work at their lead—the Burlington—located in close proximity to the mill, taking out ore to supply the mill when started.

Utah.

ALTA MINES.—Cor. Salt Lake *Tribune*, Nov. 23: The Flagstaff works 125 men, and is shipping plenty of ore. The company have leased the Bay City tunnel and are driving it through to tap their ledge. The Lavinia or Grizzly mine works 70 men and ships 30 tons of ore per day. This is one of our leading mines, and to all appearances will hold its own in the future. The Prince of Wales is working 70 men. They are trying the experiment of allowing each man a percentage on the ore he takes out, a plan which is proving successful and gives general satisfaction. Their new steam drifting and hoisting works will be in operation in a few days. The Read & Benson works 30 men. They have struck some rich bodies of ore lately and the mine never presented a more prosperous appearance. The Crown Prince and Frederic mine works 12 men in their upper works, and are driving their tunnel to tap the mine at a great depth. The Ohio mine is working a small force and shipping some ore. The Utah mine has made some large strikes lately of very rich ore. The Utah bids fair to become one of our leading mines, and we congratulate the lucky owners. How many fortunes lie sleeping in our mountain sides waiting for men of nerve, combined with muscle or means, to bring to daylight, none can tell.

BINGHAM.—Salt Lake *Tribune*, Dec. 3: This portion of the canyon is now enjoying a serenity that is not at all desirable, either in a financial or business point of view. Few mines are working, and even those that are afford employment to but few men. It cannot be accounted for in the light of lack of ore, for the mines of Bingham are as rich to-day as ever they were in her greatest prosperity. For some time past the standard for lead ores has assumed such a high point that it is a difficult matter to extract ore of the required grade and remunerate the parties for their time and labor. Owners of smelters contend that they cannot realize sufficient from their bullion to warrant a deduction in their standard, but with the present price of silver and lead, it is very palpable that some one is making a handsome profit out of the sweat of the brow of the hard working miner.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

FOR WEEK ENDING NOVEMBER 28TH, 1876.

BUROLAR-ALARMS.—John P. Everetz, S. F.
MITER MACHINES.—Allen H. Putnam, Oakland, Cal.
EXPLOSIVE COMPOSITIONS.—Charles De Lacy, S. F.
PILE DRIVERS.—Richard Hillyer, S. F.
TAP AND FAUCET.—Antone Pfeiffer, S. F.
AXES.—John O. Rollins, Truckee, Cal.

TRADEMARKS.

GENTLEMEN'S SHIRTS AND UNDERWEAR.—Percy Beamish, S. F.
SOAP.—Albert Man & Co., S. F.

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

FRUIT AND BERRY BOXES.—Chas. W. Weston, S. F. The peculiar class of fruit and berry baskets or boxes to which this invention relates, are made of thin wood shavings or veneers. The most common method of constructing these boxes is to take two strips of veneer of proper width and cross their middles so as to form the bottom of the box. The four ends are then turned up to form the four sides of the box, and a metallic binding stiffens and preserves the proper shape of the boxes. Heretofore boxes of this class have only been made in small sizes for containing one or two pounds of small fruit, such as berries, etc. The reason of this was that the manufacturers, even in constructing the small boxes referred to, persisted that the metallic binding rim must be made in one continuous piece in order to give the boxes the requisite strength and durability, and they therefore purchased tin in the sheet in order to be able to cut out single strips of sufficient length to encompass the entire top of the box. Mr. Weston has discovered, however, that he can employ any number of short strips of sheet metal for binding, not only the small boxes, but that he can also manufacture large boxes or baskets capable of containing large fruit, and at the same time render them sufficiently rigid and durable. This enables him to make small boxes cheaper than heretofore, because he can use certain kinds of scrap tin—the refuse of tin shops—for the binding straps; and it enables him also to produce as a new article of manufacture, large baskets or boxes made in this way.

TAP AND FAUCET.—Antone Pfeiffer, S. F. This patent embraces certain improvements in that class of faucets and taps which are intended to be permanently secured in the head of a barrel, and are provided with a valve which is opened by the aid of the faucet introduced to the tap and through which the liquid is to be drawn. These taps, as usually constructed, have various forms of valves, most of which have screw threads upon the outside, so that after the faucet has been screwed a part way it will take hold of the valve and open it (either by screwing it inward or outward) by the time the faucet has reached its seat, while the latter must be carefully protected from leakage by closely fitting packing. This invention consists in the employment of a tapering plug ground to fit the inner end of the tap, with its large end toward the interior of the barrel, while its small end is provided with a lug or lugs, which fit into a slot made transversely in the end of the faucet. The faucet is pushed directly to its place and is secured by a gland surrounding it and screwed into the tap, making a tight joint by pressing an elastic washer against a nut or shoulder within the tap. Holes are made in the plug and in the sides of the tap and when the faucet is turned a little it opens a passage in the manner of an ordinary faucet.

BALING PRESS.—A. D. Miller, Sacramento. This invention relates to certain improvements in baling presses for hay and other materials, and it comprises the compression of the bale rapidly and powerfully by means of a double fuse in combination with pulleys and rope wheel; a novel means for locking and unlocking the doors of the press; and a method of making the bale perfectly true, and rectangular and for releasing it easily from the press after it is secured. It also comprises means for compressing the bale at the points where the rope, wire or other confining device encircles the bale, so that when it is removed from the press it will not spring and become too large. There are several other devices covered by the patent.

PILE EXTRACTOR.—Richard Hillyer, S. F. This is a device for pulling wooden piles and other wooden beams or timbers, such as are driven into the ground to serve as a support for wharves and other structures. When a wooden pile breaks off below the surface of the water it becomes dangerous to shipping, and, as an obstruction, requires to be removed; and being entirely submerged, it is often difficult to find its exact position, in order to attach a gripping device, so that it can be pulled out. This improved gripper is so constructed that it is also a feeler for finding the pile.

MITER MACHINE.—A. H. Putnam, Oakland. This invention is an improved machine for cutting miters and bevels, and consists in a combination of arrangements and devices difficult to describe without the aid of engravings.

Mining Accidents.

A number of mining accidents have occurred since our last issue, although fortunately none of them were such as to cause a number of deaths at once. The most mysterious of these accidents was that which caused the death of John Gallaghan in the Imperial mine, on the Comstock. As one of the miners of the Bullion was descending the incline of the Imperial, on his way to the combination drift of the Alpha, Exchequer and Bullion mines, which is being run from the 2000-foot station of the Imperial, he was surprised to find, some 20 or 40 feet below the 1700-foot level, the body of John Gallaghan. The *Enterprise* says: There is much that is mysterious about this death in the depths. Previous to the discovery of the corpse the man had not been seen since 11 o'clock of the night before. At that time he was lowered down the Yellow Jacket shaft to go as watchman to the drift where he was accustomed to work as watchman, the first of the Imperial not being running and it being more convenient to reach the 2000-foot level of the Imperial that way. The body was found 300 feet out of the way and above where he should have gone from the incline of the Jacket. He had thrust his candlestick into the timbers of the incline, the candle had burned out and death found him alone in the darkness. In the meantime the man he was to relieve toiled all night, unconscious of the fact that his friend was a corpse 300 feet above. The temperature of the incline at the point where the body was found is from 110 to 120 degrees. It hardly seems possible that deceased could have been so soon overcome, however, after leaving the 1700-foot level, if indeed he was passing down and not up at the time, for there was on that level plenty of fresh air and water. There was also a cooling house but a short distance below where his body was found. The cause of his death is as yet a mystery.

A fatal accident occurred last week at the Exchequer mine, Alpine county, Thomas P. Floyd, a miner, having been instantly killed by a cave in the drifts in which he was working.

The *Enterprise* says that about 10 o'clock last Sunday morning a deplorable accident occurred at the mouth of the Sutro tunnel. While H. L. Foreman, time-keeper at the tunnel, was engaged in boxing up some explosives which had been condemned as unfit for use, some three hundred of them exploded, tearing to fragments the structure in which they were and very serionsly, if not mortally, wounding Mr. Foreman. His right arm was laid bare to the bone, his face burned to a crisp, his right eye damaged beyond recovery, and his entire right side so badly torn and mangled that even should the injuries received not prove fatal he must forever lose the use of his right side. Mr. Foreman is a young man about 28 years old, a first-class mechanic, and a mathematician and scientist of no mean ability.

Richard Cowell was severely hurt about the head and back on Wednesday, by a cave in the face of the drift which is being run from the C. & C. shaft to connect with the 1650-foot levels of the Con. Virginia and California mines.

A shocking accident occurred at the new shaft of the Yellow Jacket mine on Monday. A miner named John D. Harris, familiarly known as "Doc," was working in the shaft about 15 feet from the bottom. One of the men on top was ordered to send some tools down, and in putting them into the bucket a hand-axe fell, striking Harris in the center of the crown of the head. The skull was split clear down, and a piece of bone three inches long by two and half inches wide and several small pieces were taken out by the physicians. The injured man retained his consciousness from the first and there is a possibility, although very little probability, of his recovery. The axe fell 130 feet.

There came near being a very serious accident at the Con. Virginia hoisting works last Sunday, according to the Virginia *Enterprise:* At the time of changing shifts in the mine it is customary for nine miners to stand on each cage as they are raised from or lowered into the depths. Sunday, as a double-decker with its double load of eighteen miners was descending, the cage in some way became fixed in the guides and stopped. The heavy cable began piling down upon the bonnet of the upper cage, threatening the lives of all on board. Fortunately the watchful engineer discovered the absence of weight upon the descending cable and stopped the engine before any great amount of slack had accumulated. One of the men was slightly injured, however, as it was, but was able to be about yesterday. Had the whole amount been paid out the cage and all thereon must have been crushed like an eggshell beneath its weight, or it would have broken through its obstructions and descended with fatal speed to the bottom of the shaft.

The Gulf of California Oyster Company.

The above company is an institution just organized to develop a comparatively new interest among us, and is destined in all probability to become a very useful organization. The California oysters are, as is well known, quite inferior, and the Eastern oysters are very expensive, while the bivalves which exist in such numbers in the Gulf of California are of splendid quality, large size and inexhaustible in quantity. This company has been organized for the purpose of supplying our market with oysters, and it is intended to go to work on a large scale to carry out the project.

Thus far the oyster most esteemed in the United States is found on the coast of Virginia. It exists in large numbers in Chesapeake bay, and the same species is sometimes found in the vicinity of Boston and also at the river St. Lawrence. Another species is called the northern oyster, which finds the largest sale in New York. The main sources of supply are the Chesapeake bay, the coast of New Jersey and Long Island sound. The wholesale trade of New York alone is estimated at $25,000,000 a year, and that of Chesapeake bay is probably nearly as great. These figures will throw some light on the importance of the project of the new company. The supply in the Gulf of California is very large, and the oysters exceptionally fine. The difficulty heretofore has been proper means of transportation, so that the field has been neglected. With the completion of the Southern Pacific railroad to Fort Yuma, however, this difficulty is removed. The company will have canneries on the spot, employ cheap Indian labor for gathering the oysters, and 200 or 300 of California boys for canning and packing. It will also have an ice manufactory on the ground and own vessels for shipping the oysters from the gulf to Fort Yuma, taking return freights.

In order to give the best effect to the operations of the company, the arrangements will be very complete. It is expected that the Southern Pacific railroad will connect with Fort Yuma in the early part of next year, when tank and refrigerator cars will be provided for shipment of fresh oysters. A line of boats will bring the oysters from the gulf to the Fort in 48 hours, and 50 hours more will transport them by rail to this city. For greater convenience temporary beds will be made at the mouth of the Colorado river, where the cargoes of boats from the gulf will be left, to be again taken up immediately before the departure of a train, so that they will arrive in San Francisco 50 hours after being taken from the water. Several beds of the oysters will also be made in San Diego and San Francisco bays, where it is confidently believed they will rapidly breed. Canned oysters will form a great specialty of the company, and cannot fail to be highly remunerative. There will be a market for these oysters in Eastern cities and in London, where the consumption will be large and constant enough to absorb all the supplies which can be sent from this coast. Another branch of the business will be drying coarser varieties of oysters for the China trade.

The officers of the company are A. Blacklock, president; Don Ramon Jose Gonzales, vice-president; William S. Manning, secretary and S. J. Priaglove, treasurer. Before incorporating, the officers thoroughly informed themselves on the breed of oysters in the Gulf of California, purchased rights from the Mexican government for the exclusive use of the beds, entered into arrangements for securing all appliances for canning as well as for the purchase of an ice manufacturing machine of Senator Jones' patent; provided for the charter of boats to carry oysters to Fort Yoma, and had an understanding with the railroad authorities in regard to transportation.

IRON MINING IN CALIFORNIA.—The Eureka mining company has just been organized to mine and work hematite ores at Placerville, El Dorado county. The company have 80 acres of land, well timbered, on which is also a fine marble quarry; also, on the same ground, is a limestone quarry. The company has also secured the refusal of 320 acres of adjoining land, well timbered, and containing mineral. It is the purpose of the company to immediately erect works for the manufacture of iron, especially shoes and dies, etc., for quartz mills, working Catalan furnaces, and forging the iron indirectly from the furnaces, which will be double the value of the cast shoes and dies.

Mechanical Ore Concentration and Separation.—No. 13.

[Written for the Press by Francis M. F. Cazin, M. E., Santa Fe, New Mexico.]

The question of "wet or dry" being thus determined, by mere necessity and want of practical success of the dry method, in favor of wet concentration, the next point to decide upon is the selection of apparatus. Neglecting all unimportant supplementary contrivances, I shall consider the important ones only:

I. Utilizing vertical intermittent and horizontal permanent streams of water in free contact with ore particles (jigs).

II. Utilizing the contact between the ore particles and solid faces in addition to a permanent horizontal or inclined stream of water, with or without concussion motion (tables).

III. Utilizing an uninterrupted stream of water, and the depositing tendency with different speeds of such stream (spitzkesten, flames, streaming apparatus).

Of these three classes I intend to describe the most prominent specimens, especially those having had an undoubted practical success. It remains to specify the kind of work that can best be done by the different apparatus.

This work can be divided by the size of the material to be worked. Efficient jigs should work all sizes from the largest down to one-half millimeter (one-fiftieth of an inch). The apparatus of the second and third class should work one-half millimeter size and all smaller sizes. It is unsafe to work smaller sizes than one-half millimeter with jigs, and only poor results can be attained in working coarser sizes than one-half millimeter on any of the tables. This being established by experience, all attempts in another direction can have only a very limited success, and only under extraordinary circumstances favoring the excess in either, as may be the case in the nature of the ore, or in extraordinary skill in handling the apparatus.

Jigs.

In the most primitive way jiggiag is done by a man holding a sieve in his hands and plunging it down into the water. He withdraws it and repeats his plunging motion; he thereby attains the jigging motion. Hengiag the sieve to one end of a beam end taking hold of the other in order to give the jigging motion to the suspended sieve is another mode of jigging. These contrivances may do where a man is in the same position as an Indian who needs flour; if water or steem mills cannot be had to grind the wheat or corn, a coffee-mill or smooth rock must answer. This treatise is, however, written only for those who wish to dress minerals in the cheapest and most efficacious way possible by the most improved contrivances; therefore I do not intend to describe the hundreds of different jigs that have been in use in different countries at different times. Changes in shape were frequently made to accommodate local peculiarities; improvements were made by a proper appreciation of principles: but prejudice, nonrished by custom, obstinacy, ignorance and boastful vanity, prevented a general and thorough reform of established imperfections, until an entirely different shape was given to all things belonging to mineral dressing by the appearance of Ritter von Rittinger's book on the Science of Mineral Dressing.

Mining in Butte County.

We had a conversation this week with a gentleman from Oroville, Butte county, who informs us that the mining interests of that section of the State are in a much more promising condition than for some time past. In his opinion it will not be long before the Butte county mines, generally, will be in a more prosperous state than ever before. A number of new enterprises have, of late, been taken hold of by men fully capable of carrying them out on a proper scale. All the mining being done is on a legitimate and not a speculative basis. This county has, like others, suffered from speculators taking hold of ground and getting up companies more for the purpose of manipulating stock than for legitimate work. The miners now, however, who are at work and those who have lately purchased claims are devoting their attention to legitimate work.

Among the enterprises mentioned by our informant, is that being carried on by Powers & Co., of Oakland. W. B. West owned 1,500 acres of gravel ground near Oroville, which fronts for about three miles on the river. He had also a ditch which carried about 1,000 miners' inches of water in the wet season. Working this ground with one giant and three men, in a small way, he made a profit of about $100 per week. This property was purchased last February by a company of three persons—Powers & Co. They have enlarged the ditch and put the property in order for better work. Part of the ditch is about five feet wide on the bottom and it will probably be connected with another so as to float down lumber. The supply of water will be increased in the winter to about 3,000 inches, and several giants added so as to work more ground in front. The property has turned out about $3,000 per month since it was worked on a larger scale, and could not now be purchased for $100,000, although originally purchased for $45,000. The ditch has been enlarged; the water is light yet and will be until the rains set in.

A number of other instances of like character were mentioned by our informant, showing that the present owners of mining property are going in for legitimate work; and whenever they have done so, good profits have been the result. The people find that more money can be made by going to work in the right way than by trying gigantic speculations—on paper—or getting up big companies, which never do any mining.

General News Items.

The American mining board, recently organized in New York, has extended its business to railroad and miscellaneous securities.

A London dispatch states that an extradition treaty between the United States and Great Britain has been arranged.

A Rio Grande dispatch says that General Diaz has entered the City of Mexico, and that Lerdo and his Ministers have fled westward.

The Cambridge University boat club has declined the challenge of Yale and Cornell to a four-oared race on the Thames next year.

The hearing of the Lick estate contestants was set in the Probate court yesterday for January 3d, 1877. A venire for 48 jurors has been issued.

There is still great distress in portions of India. There are no crops for want of rain. Cholera has appeared in Bombay, and is increasing.

A dispatch from New York, dated the 5th inst, states that the Brooklyn theater was burnt that night. Loss about $300,000. About 300 persons were killed.

Colonel Gordon, the African explorer, has arrived at Cairo, after an absence of three years. The Antinori, or Italian exploring expedition in Africa, has arrived at Liece. It was expected to set out for the Equatorial lakes.

Harry Andrews, for nine years connected with Woodward's Gardens, retires from its management, his health not having been good for some months past. After a few months' rest he will enter a mercantile career.

A Bethlehem, Pa., dispatch says that more than one-half of the mines in that State are closed. The number of men thrown out of employment is estimated at between 35,000 and 45,000. It is believed that the suspension will be entire by the middle of the month.

The Associated California Pioneers in New York have inaugarated a series of monthly receptions for the reviving of old ties, swapping of pioneer experience, and eliciting and recording personal and historical facts connected with pioneer days.

Small-pox is raging at White Mud river, Minnesota, and many Indians and Icelanders have died of the disease. The government storehouse has been converted into a hospital, the sick removed there and their vacant dwellings burned.

A rebellion has broken out in Buenos Ayres, headed by Colonel Alsina, Minister of war. Gold is at a premium of 30 per cent. The first reports of the Buenos Ayres insurrection were grossly exaggerated. Order has not been disturbed, but the government has declared a state of siege in four provinces to prevent the fomentation of disorder by bands of desperados.

In this State during the week there have been indications of rain, but no water. In some counties this lingering of the elements is greatly regretted. Rain is now needed to help along the volunteer and early sown grain, and to start the plows on the new fields. In the city trade is also awaiting the rains and the resumption of activity in the country.

On Monday Congress met in Washington, and on Tuesday President Grant transmitted his eighth and last annual message. Contrary to general expectations this document contains no allusion to the election difficulty which is now vexing the country. The message gives a review of the country during Grant's administration and notes other matters which, at this time of excitement, will not largely occupy the public mind. The House of Representatives has elected Samuel J. Randall, Democrat, of Pennsylvania, to the speakership. Up to this time both houses of Congress have done little but effect their organization and receive the message of the President.

The eastern districts of Bombay are reported rapidly recovering from the effects of the cyclone. The damage to the crops is less than was expected, but the loss of life has probably not been overestimated. Ninety per cent. of the plow cattle were lost. Sickness prevails, but fears of destitution are removed.

The main building of the International exhibition was purchased by the International exhibition company for the sum of $250,000. The auction sale of 24 buildings belonging to the Board of Finance and 20 belonging to individuals, brought, on the exposition grounds, $776,000. Their cost was $2,500,000.

The Tulloch automatic ore feeder has received an award from the Centennial committee of appeals.

Woodward's Gardens embraces an Aquarium, Museum, Art Gallery, Conservatories, Tropical Houses, Menagerie, Seal Ponds and Skating Rink.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office at San Francisco:

Onoreless Excavating Apparatus Co. of S. F.—Nov. 30th. Capital stock, $100,000. Directors—D. E. Root, Francisco Taylor, John Mallon, O. Van Buskirk and James Fairclough.

Eureka Mining Co.—Dec. 3d. Location, El Dorado county; principal place of business, Oakland, Alameda county. Object: Mining and working iron and other metals. Capital stock, $600,000, in 12,000 shares at $50 each. Trustees: A. W. Bishop and W. M. Kellar, of Oakland; John C. Brewster, A. J. Kennedy and Geo. J. Blanchard, of Placerville.

Potsdam Compressed Yeast Co.—Dec. 5th. Object: To buy and sell yeast and liquors and the materials necessary for making yeast and liquors. Trustees: Charles Schroth, Peter Becker, Gustave L. Page, Wm. Westerfield and Louis Hemme.

Lookout Coal and Transportation Co.—Dec. 5th. Object: To deal in coal, lumber and wood. Capital stock, $2,500 000. Directors: Charles W. Frazer, John W. Pearson, Charles E. Pearson, David M. Seaton and Peter M. McLaren.

The Moscow *Gazette* says a fund is being subscribed for the purchase in America of letters of marque vessels, to be employed against English merchant shipping in the event of a war between England and Russia. Similar subscriptions have been opened in other Russian towns.

The result of the recent presidential election still remains in doubt.

Quicksilver in S. F., by the flask, per lb, 55c.

It is not unusual for patients suffering from diseases for which sulphur baths are recommended, to travel thousands of miles to avail themselves of sulphur bathing. They would find it less expensive to buy Glenn's Sulphur Soap and bathe at home. Sold everywhere.

Knight's American Mechanical Dictionary is a book for all persons who make, buy, sell, use, or want to know anything about tools for machines, or are curious as to the history and development of mechanic art. It is a descriptive word-book of tools, instruments, machines, chemical and mechanical processes; civil, mechanical, railway, hydraulic and military engineering; a history of inventions; general technological vocabulary; and digest of mechanical appliances in science and the industrial and fine arts, etc. For circulars or price address or apply to A. Roman & Co., wholesale and retail booksellers, 11 Montgomery street, San Francisco.

Goon Printing Ink.—We prefer Chas. Enen Johnson's printing inks, having used them on this paper for the past four years. H. S. Crocker & Co., printers, stationers, blank book and paper dealers, are Johnson's S. F. agents.—Dewey & Co., Publishers.

Sacramento, May 29th, 1875.

Messrs. Dewey & Co.—*Gentlemen:*

Yours of the 27th inst. is received. The patent came only to hand yesterday, by express. Please accept thanks for your promptness in obtaining the same.

Very respectfully, Duncan Beaumont.

CHALLENGE ORE FEEDER.

$1,000 Challenge Ore Feeder and the Tulloch Feeder. A letter has been received from the Crescent mine, Plumas county, in which it states that the Tulloch is a failure as against the $1,000 Challenge Feeder of HENDY'S, 49 and 51 Fremont street, San Francisco.

To Mining Secretaries.

An amendment to Section 338 of the California Code, taking effect July 1st, 1874, provides that in addition to the regular publication, daily or weekly, of the assessment and sale notices as heretofore,

PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"*The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where the principal office of the Corporation is situated.*"

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

DEWEY & CO., Publishers.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

The Golden Sun Gold Mining Company.

Notice is hereby given that the regular annual meeting of the stockholders of The Golden Sun Gold Mining Company will be held at the office of the company, No. 702 Market street, (up stairs,) San Francisco, Cal., on Monday, the 11th day of December, A. D., 1876, at one o'clock P. M., for the election of Trustees of said company for the ensuing year. The transfer books will be closed on December 4th, 1876, at three o'clock P. M., and remain closed until after the meeting. By order of the President,

JOSEPH PENTECOST, Secretary.

Josephine Gravel Mining Company.—

Principal place of business, San Francisco, Cal. Location of works, Brushy Canyon, Placer Co., Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the sixth day of December, 1876, an assessment of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, No. 531 California street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the eighth day of January, 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the 25th day of January, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

WM. SMALL, Secretary.

Office Room 1, No. 531 California street, San Francisco, California.

Mariposa Land and Mining Company

of California. Location of principal place of business, San Francisco, Cal. Location of works, Mariposa County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the ninth day of November 1876, an assessment, No. 8, of one dollar per share was levied upon the capital stock of the corporation, payable immediately, in United States currency, to the Secretary at the office of the Company, room 33, Nevada Block, No 309 Montgomery street, San Francisco, Cal., or to the Assistant Secretary, at the office, No. 9 Nassau street, New York, N. Y.

Any stock upon which this assessment shall remain unpaid on the 11th day of December, 1876 will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the eighth day of January, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors

LEANDER LEAVITT, Secretary.

Office, Room No. 33, Nevada Block, No. 309 Montgomary street, San Francisco, Cal.

Cerro Bonito Quicksilver Mining Company.

Location of principal place of business, San Francisco, Cal. Location of works, Cerro Bonito mining district, Fresno county, Cal.

Notice is hereby given, that at a meeting of the Board of Directors held on the 13th day of November, 1876, an assessment (No. 1) of four dollars per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, 418 California street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 14th day of December 1876, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the eighth (8th) day of January, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors

Reno, Nevada.

PICKERING ENGINE GOVERNOR.

Vallejo Foundry, October 17tb, 1878.

MESSRS. NEYLAN & YOUNG, San Francisco,

Agents "Pickering Govsrnors."

Gents:—Tbe 10 two-inch Improved Speed Adjusting Governors I bought of you this ysar for my Patent Straw Burning Tbreshing Engines give splendid satisfaction. They far surpass for regularity of speed any Governor tbat I have svsr seen, and I havs seen all of the best kinds; I have ssen the main bslt fly off the pulley several times this season wbile thrsshing, and tbe enginesr did not discover it, so perfectly was the speed maintained, until bs was told of it; this I consider something wonderful; I consider the Governor absolutely perfect, so far as speed is concerned. I bought, and put on to one of my engines a Shive Governor, to see which was the best and after one season's trial I have no besitation in saying they are as far superior to ths Shivs, or any other Governor tbat I bave seen or used, as the Shive Governor is to the old Butterfly Valve Governor. I wish you would send me the lowsst price that you can furnish 25 Governors for next season's engines.

Yours, respectfully, I. L. HEALD.

LOOK

The Great Western Scroll Saw Co.'s New and Improved $5 00 Foot and Steam Power Scroll and Bracket Saw is the best one yet iovented. With it men and boys are making from $3 to $10 per day. We will send you a Machine, six Saws, 15 Patterns and two feet of prepared wood on receipt of $5. Address,

ASBESTOS PAINTS, all colors, ready for use, in pails, kegs and barrels. ASBESTOS FIRE-PROOF COATING, for inside of Factories, Railroad Buildings, Bridges, etc.; no danger of ignition hy fire; a perfect protection. ASBESTOS BOILER AND PIPE COVERINGS—Paper, Thread, Cloth, Plastering Board, etc. Live and responsible men wanted in every city and town. A good business can be made with our Roof Paint and Cement Repairing Leaky Roofs.

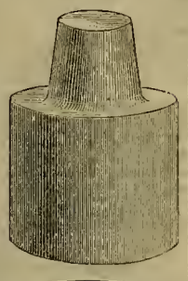
THOMPSON & UPSON,

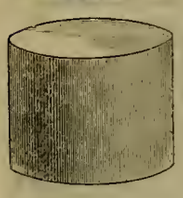
Exclusive Importers for the Pacific Coast for H. W. JOHNS' Patent Asbestos Materials,

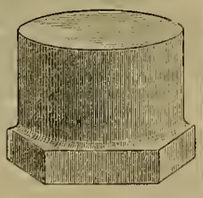
No. 5 FIRST STREET, near Market, San Francisco.

PATENTED

CAST STEEL SHOES AND DIES.







Guaranteed Cheaper than the Best Iron.

IMPORTANT NOTICE.

Reduction in Price from 16 Cents to 12 Cents Per Pound.

Owing to our largely increased busineas, the present low price of Iron from which our Steel is manufactured and the improved facilities for casting and forging, we take great pleasure in annonncing that from and after this dare we will supply our IMPROVED CAST AND FORGED STEEL SHOES AND DIES FOR QUARTZ MILLS at 12 cents per pound, delivered at San Francisco or Sacramento, instead of 16 cents, as heretofore.

We also furnish Steel Plates for Blake and other Ore Crushers, Steel Gut Gearing, etc., for Mills and Hoisting Works, Steel Pan Shoes, Battery Cama and Tappets, etc.

Address all orders, with dimensions or drawings, to

CAST STEEL SHOE & DIE CO.,
59 Nsvada Block, S. F.

UNITED STATES

Mineral Land Laws, Revised Statutes,

And Instructions and Forms Under the Same.

We have jnst issned a pamphlet containing the general mineral land laws of the United States, with instructions of the Commissioner of the Land Office The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statnte of May 10th, 1872, with Instrnctions hy the Commissioner of the Land Office; Mining Statute of Jnly 25th, 1866; Mining Statnte of July 9th, 1870 Forms reqnired nnder Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Survey; Application for Patent; Proof of Posting Notice and Diagram of the Claim; Proof that Plat and Notice remained Posted on Claim during Time of Pnblication; Regis; ters' Certificate of Posting Notice for Sixty Days; Agreement of Pnblisher, Proof of Publication; Affidavit of $500 Improvements; Statement and Charge of Fees; Proof of Ownership and Possession in Case of Loss or absence of Mining Records; Affidavit of Citizenship; Certificate that no Snit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no Known Veins Exist in a Placer Claim, eto. There is also given the U. S. Coal Land Law and Regnlations thereunder. The work comprises thirty pages, and will he sold. post-free, for 50 cents. It shonld be in the hands of every one having any mining interests. DEWEY & CO.,

Pnblishers of MINING AND SCIENTIFIC PRESS, S. F.

The Scientific Press Engraving Company.

As has been announced in onr columns, this company is prepsred to do fine wood engraving on favorable terms. Mr. E. Schultze, managing psrtner, served a thorongh tnition in his branch of art in Germany and New York, and has since had over seven years' experience in designing, drawing and engraving in California. Customers can place their orders in Mr. Schnltze's hands with the fnll assnrance of receiving satisfaclion as to quality of work and fairness of price.

ISSUED OCT. 1st, 1876.

Testing and Working Silver Ores.

The above is the title of an illustrated work of 114 pages, for miners and prospectors by Chas. H. Aaron, which has jnst been issned by Dewey & Co. Mr. Aaron has managed to give many usefnl hints and suggestions, free from all technicalities, and in such a style as to he easily comprehended. It is written for the miner, with no chemical symbols or metallnrgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope:

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipo. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working sample, appliances for testing, roasting, etc. Under the head of "Working Ores" the anthor describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphnr, eto. Under the head of "Leaching Processes" are the titles, Smelting, Mexican process, Kroencke's process, Chilean process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pnlverizing harrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, eto.

In speaking of amalgamators the anthor describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, nse of quicksilver, copper in bars, Freiberg barrel, cheap harrel, trongh, barrel on rollers, Aaron's amalgamator, separator, eto.

He describes an improved retort, roasting fnrnace, fnrnace tools and fnrnace building. Among the miscellaneous mention may be found Aaron's leaching apparatns, with two or three different arrangements, a small mill, sampling tailings and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

The book is a serviceable one for miners' and prospectors' use. Price, post free, (in leather,) $2.00. Address Dewey & Co., MINING AND SCIENTIFIC PRESS, 224 Sansome street, San Francisco.

The Explorers', Miners' and Metallurgists' Companion.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Pnblished or issned, wholesale and retail, hy DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose pntation is unsurpassed in his specialty.

Price $2.50 coin, or $3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphnrets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled hy any other published, embracing the subjects treated. Its authority is highly steemed and regarded by its readers; containing, as it oes, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable hy being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

Superior Photographs.

To be sure of a good picture, you have only to patronize G. D. Morse's Palace of Art, at No. 417 Montgomery street, S. F. The pnblishers of this journal have patronized Mr. Morse for meny years, and do not hesitate to say that his pictures are not excelled by any we have seen prodnced in this or any other country. No one can ask for a better man to patronize than Mr Morse. He is affable and respectfnl to all.

BOUND VOLUMES of the MINING AND SCIENTIFIC PRESS from Jan. 1st, 1854, are for sale at this office at $5 per volume, two volumes a year. Unbound at $3 per volume.

VOLUME XXXIII. Number 25.

Rock Drills and Hoisting Engines.

Dnring a recent viait to the Eaat, Mr. A. L. Fish, of Nos. 9 and 11 First street, secnred the agency of aeveral kinds of machinery, which he ia now introducing on this ooaat. The most important, at leaat to the mining commnnity, is a naw rock drill for steam or compressed air. It ia called the Union rock drill, and is a ccnsolidation of the patanta owned by the Winchsster rock drill company, G. H. Reynolda and the Delameter iron worka.

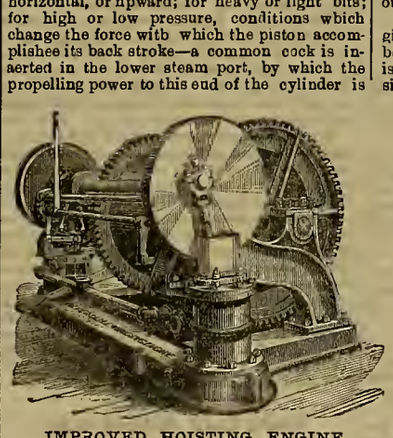
Maohine drilla hava now hecome such a necessity in engineering and mining operations that tha minds of prominent engineera have heen bnsy with the constrnction of machines that wonld aupersede tha slow and tedions procesa of hand drilling. Tha resnlt has been a acore of contrivancea more or less well adapted for the purpose, and the firat drill of Sommeiller haa been aacceeded by those of Dnbois-Francois, McKean, Waracp, Darlington, Kainotcman, Sachs, in France, England and Germany, and those of Burleigh, Ingeraoll, Rand, Waring and Winchester, in America. All of them have made a reputation, hut atill the success has heen an incomplete one, and will probably remain so for a long time to come. The conditiona nnder which a rock drill ia made to work are of a natnre whioh excludes the posaibility of continned working without a comparatively great amonnt of repairing. Exposed in tha open air to the action of rain, to the ill treatment of inexperienced men and to great abnse in general, it belonga to a claaa of machinea that mnst, in certain parts at leaat, give ont sooner than one whicb is constantly in the hands of a painstaking and skillfnl attendant. To rednce the liabllity of getting out of order, and to make a machine at the esme time light and effective and easily handled, are probably the essential points to be fulfilled.

The new machine which A. L. Fish & Co. now offer to the mining pnblic, is, as before stated, a combination of the patenta of E. S. Winchester, George H. Reynolda and C. H. Delameter & Co., and promiaes to answer all tha reqnirementa of a good rock drill in an nncommon degree. The accompanying engraving ahcwa the general featnres of the drill. All the parts composing the valve gear and rotation are completely protected and ont of view; still they are easily accessible. The valve gear ia very aimple, and the maobine can he rnn at any desired apeed without danger of getting it out of order. The tappet by which the valve ie moved hanga down loosely, having no apringa or coils about it, and ae it is made itself of an elastic apring is not affected by any sudden blow. It ie ao arranged aa to move easily and quickly without the alightest chance to get out of order by any violent impact of the piston. The valve ia ao arranged that when desired it can be turned from the outeide by a simple motion ao as to draw back the drill; this obviatea the necessity of pnshing the drill back by main etrength when it is desired to withdraw it. When drilling npwards the port can be so adjnated that ae little steam or air ae desired ie admitted to draw the drill downwarde, altbongh the full force is still exerted npward. Thie is of great advantage, as in drilling upward the drill is aided in ite backward motion by ite own weight, and ia apt to come back harder than necessary.

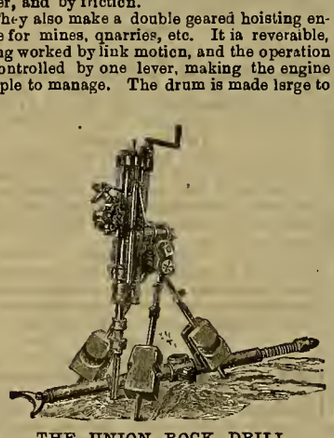
The rotation ia antomatic and absolntely certain. The ratchet wheel ia provided with two pawls, whioh act alternately, thne admitting of the nae of a larger and stronger ratchet wheel, the ratcheta not being so freqnent on the circnmference of the wheel. On the back atroke the drill revolves slightly eo ae to change the cntting edge with relation to ita laat atroke, bnt it ie held rigidly by the pawl engaging with the ratchet in ite forward etroke. A projection from thie ratchet to the outside of the machine allows the operator to rotate the drill more or lesa as desired, so that in case the drill geta in a crevice it can be rapidly rotated by hand while the blowe are being atrnck. Thia will give a clean finish to the hole. The feed ia regulated by band from the back of the machine.

The upper head of the cylinder can never be struck by the piston, because the chuck ord rill holder firet meets a hardened steel ring which projects ont of the stuffing box of the lower head and which rests on the elastic packing of the stnffing box itself. For the down blow n eimilar bat much larger steel ring is inserted in the inner side of the lower head, and this also is bedded on an elastic ring of rubber, the latter entirely enclosed by the metal and removed from the action of the steam or the friction and consequent wearing by the piston rod. The drill itself fits closely against the piston head. The chuck ia qnite simple and holds the drill effectively, while it is not liable to get jammed so as not to readily release the drill when desired. The drill is held in place by large rings, which close over it on the wedge principle, no screw action being used.

The packing ringa are atationary in the cylinder, ao that the jar or motion of the piston cansea no motion of the rings. The cylinder heads are very securely fastened on in a manner which leaves no liability of breakage. Bolts run atraight along the ontside of the apparatus from one end to the other and bold on the cylinder heads, thus distributing the strain on four iron rods. To accommodate the drill for different directions of drilling—for downward, horizontal, or npward; for heavy or light bits; for high or low pressure, conditions which change the force with which the piston accomplishes its back stroke—a common cock is inserted in the lower steam port, by which the propelling power to this end of the cylinder is



IMPROVED HOISTING ENGINE.



THE UNION ROCK DRILL.

nnder complete control of the attendant, and yet allows a perfectly free exhaust from the same side when the piston returns to perform the blow on the rock.

The tripod for the drill combines all the advantages that can be desired ot this part of the machine, admitting of a motion in all directions. The legs are slightly flattened on two sides so as to give a very strong hold to the clamps, and keep the drill securely in position. For mounting the drill on a column or etretoher-bar it is necessary to nnscrew only one nut and the whole apparatus can be nnecrewed from the tripod and set on the bar. All the mechanism of the anparatna is made in the strongest manner and the machine is at the same time quite light and portable.

Mr. Fish has also brought out the Union drill company's coupling for hose. The hose ie pnt on the ends of the pipes and clamped tightly with nuts. Then a qnarter of a turn will nncouple it when necessary. The connection ia made by simply slipping the ends together and giving a quarter of a turn; different sizes are made. It is impossible for the clamp to slip off, and at the same time an air-tight joint is made.

The Hoisting Engines.

The hoisting engines which Mr. Fish is introducing, are manufactured by Copeland & Bacon. Several styles are made. Some of the engines are intended for use where one or more are needed to be operated from one boiler, as is frequently done in warehouses, factories, breweries, steamships, quarries, and in all kinds of contractors' work. The engines are supplied with either clutch and brake or link motion for reversing, enabling them to be controlled in hoisting or lowering or stopping by the use of one lever; by this means the heaviest weights can be lifted with much more safety than with the ordinary clutch and brake. In most of these engines both the link motion and the clutch and brake are furnished. The double geared engines are intended for extra heavy work in quarries and are provided with both the link motion and clutch and brake. They are calculated to lift double the weight of single geared engines at a proportionate rate of speed. The differential geared engines are intended for both light and heavy hoisting and combine the advantages of both the single and double geared engines, as by simply shifting the clutch the engine can be made either single or double geared, or can be run separate from hoisting gear, and with the single engines can be used for pumping. They are furnished with a link motion and clutch and brake, and for a great many kinds of work, where the material to be raised varies in weight considerably—these engines are unequaled, as the power of the hoisting gearcan be doubled without changing the fall ropes, etc., as is usually the case; the lowering can be controlled by the use of either link or brake. The double cylinder engine gives double the power for about the same space occupied, and has larger drums so as to hoist quicker; it cannot be caught on the center.

A double drum portable hoisting engine for stevedores' use, pile driving, etc., is also made. The drums are worked independently of each other, and by friction.

They also make a double geared hoisting engine for mines, quarries, etc. It ia reversible, being worked by link motion, and the operation is controlled by one lever, making the engine simple to manage. The drum is made large to nse wire rope and of any width to suit depth.

The engines are all tested before leaving the works and are shipped in complete working order.

Still another is the reversible winding engine for mines, intended for very quick work. It ie provided with two steam cylinders which are single geared to a large drum. It has a link motion for reversing so as to hoist one while it lowers another bucket.

The safety steam elevator is for buildings, stores, factories, etc. Thie engine is intended to be used in connection with a passenger cage or platform for hoisting merchandise. It is safe and noiseless, having a uniform steady motion. One of these hoists is now on the way to this city for Benson's building on Pine street. It is the latest and most approved hoisting engine, with all the safety attachments, etc.

IDAHO MINES.—A. B. R. writes us from Idaho that the mines in the basin and other surrounding camps are mostly closed for the season. Quartz mining and drift diggings are prosecuted still. The last season's operations in the mines have been very prosperous and encouraging; especially have Idaho's quartz mines developed splendidly the last season. Owyhee district has been no exception as far as rich developments are concerned, but her owners have not operated successfully for some cause best known to themselves. The mines of Alturas county—Atlanta district—have astonished all who have entered their rich vaults and seen for themselves.

PIPER'S bill concerning the Black Hills country proposes the immediate creation of a Territorial Government for that region. He considers this very important and therefore will urge the prompt passage of the bill.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

ENVELOPE, NEWSPAPER WRAPPER, ETC.—L. J. Henry, S. F. The ordinary construction of an envelope of sized paper, necessitates care to prevent blotting the address after being written. This invention makes the envelope with the back for the inscription made of the usual sized paper. The opposite side is made of unsized or blotting paper, so that when many letters are to be written, each succeeding letter or paper serves to blot the ink on the preceding one. For newspapers, instead of the ordinary form of open wrapper, the inventor prefers to use an envelope or pouch closed at one end and having a flap at the other, so that the paper can be placed entirely within the pouch and protected from abrasion or dirt. One side of the wrapper is made of unsized paper. The inventor states that the work of writing addresses will be facilitated by the use of such envelope, and its usefulness will cause it to be preserved, so that the sender's business card will be retained in a prominent position.

SCOW AND PILE DRIVER.—Richard Hillyer, San Francisco. Mr. Hillyer's patent relates to an improvement in floats or scows, such as are used in supporting pile drivers and moving them from place to place in order to conveniently drive such piles as are driven into material under water. It also relates to an improved manner of securing the pile driver so that it can be adjusted back or forward according as required by the circumstances of each case. By the arrangement patented the inventor is able to drive the piles on a straight line and at the same time fasten the scow immovably while driving each pile. This arrangement also permits the inventor to use his patent gripping device for pulling piles (described in our last issue) to a great advantage, as he can work all around the pile, and he obtains the advantage of applying the downward force at or near the middle of the scow.

SPRING BED.—A. J. Lattin, Alvarado, Alameda Co. The invention relates to certain improvements in the construction of beds, and consists in a novel construction of the longitudinal slats which form the bed bottoms, and also in a means of attaching them to the coiled spring at the other end, together with certain details of construction. The invention also relates to the construction and attachment of a head and foot piece, which completes the bed.

HOSE CART REEL AND IRRIGATOR.—E. J. Delaney, San Jose. This invention relates to carts for the transportation of garden hose and consists first, in providing an arrangement by which the rotation of the axle can be made to rotate the reel for the purpose of winding up the hose when desired, and secondly to a novel arrangement by which the carriage may be converted into a standing irrigator.

WREATH PIECE FOR STAIR BUILDERS.—Christopher Lamb, S. F. The object of this invention is to provide a device for bolting the wreath pieces of stair case hand-rails in the proper angular position, to enable the workman to carry the rail properly to the band or other saw for sawing the concave or convex sides of the pieces.

BULLION FROM OREANA.—Mr. E. P. Torrey writes us from Oreana, Nev., that there has been shipped from that station during the year 1876, upwards of 420 tons of bullion. This bullion has been produced from ore extracted from the Hurricane mine, now owned by the Hurricane company, of San Francisco. They will add 100 tons to the yield during the present month. The statement of the yield was taken from the railroad company's books.

AT a meeting of the American mining board, in New York, on Monday, a new set of officers was chosen, with Tuthill as president.

CORRESPONDENCE.

Mining in Madison and Gallatin Counties, Montana.

EDITORS PRESS:—Having made the circuit of the mines of Madison county, it may be safely stated that they are doing as well, in some respects at least, as those of any county in California or Nevada.

The amount of bullion produced in the aggregate may fall far short of some, but the number of mines paying will doubtless be found greater.

Dividend-paying mines have usually been the exception. Here it is the rule. They have generally paid from the surface, are usually worked or superintended by the owners, sometimes to a great disadvantage from lack of capital, but mostly with prudence and caution. Probably to these causes in the main may be attributed the rather unlooked for success of their operations.

At Red Bluff,

Madison county, there are some promising silver mines, with ore going from $80 to $120 by wet crushing and within 85 per cent. of the assay, at Thomas & Old's mill.

The Eberhardt mine, at Havana, the property of Young brothers, of 1,400 feet in length, has worked from $60 to $80 per ton in silver. The fissure is four feet wide, with good free milling ore on each wall.

The Crown Point, at the same place, is a very rich but narrow vein, from one to eight inches, with ore principally chloride, running from $500 to $2,000 per ton, some of it even to $4,000 in silver. The ore is selected and shipped to Omaha for working.

There are several other claims here, such as the Annie and Relief, with ore and probably veins similar to the above.

The Whortleberry,

On Middle creek, Gallatin county, nine miles from Bozeman, is a late discovery, and as yet but little prospected, but giving assays from $17 to upwards of $200 in gold and silver. It is estimated from tests to work about $20 per ton. The lode has well defined walls of granite, eight feet wide and entirely filled, where opened, with good solid quartz. It is owned by Messrs. Bailey, McKenzie, Lansing and Robinson, of the vicinity.

Eastern Montana Mining and Smelting Company,

Incorporated capital stock, $500,000, 25,000 shares, with place of business at Bozeman, own seven lodes on Clark's fork, and have taken out near the surface some 200 tons of excellent smelting ore, mostly argentiferous galena, giving assays from $50 to $300, and running in lead from 40 to 60 per cent. They have also two good iron leads for fluxing and some superior fire clay in the immediate vicinity of the mines. A smelting furnace and all necessary buildings for operations have been erected. Officers: L. S. Wilson, President, J. D. McCaman, Secretary, and J. G. Dow, Treasurer.

The Republic,

In Blackmore district, in the same neighborhood, shows large deposits of rich smelting ore from three to 30 feet in width, being opened only to the depth of about 15 feet. The lowest assays run as high as $125 and some as high as $625. Eight hundred pounds, taken as it came from different points along the lode, worked at the rate of $175 per ton, going 50 per cent. in lead. The ore as seen in the sacks looked fully as well as that of the Richmond, at Eureka, Nevada. In fact, no better looking smelting ore has hitherto been met with, and said to have been pronounced by Prof. Hayden as of a very superior quality. High hopes are entertained for the future of both the above named companies. Wood and water are represented as found in the greatest abundance, and all other needed facilities for successful working.

Some Gravel and Placer Mines.

Mr. A. W. Tanner has been engaged for the past three years in this kind of mining near Havana, in Madison county, and has persevered in spite of the derision of some of his neighbors, with the full confidence that he would be able to make it pay.

He has 157 acres under a U. S. patent, that pays from eight cents to $1.42 per cubic yard, and reports the gravel range extensive, as ascertained for gulch, ranging from five to nine feet in depth, and for hills from 45 feet probably to 100 or 200 feet. He wishes it distinctly understood that he has neither ground nor water to sell, and will cheerfully answer all letters of inquiry from California or elsewhere in regard to locations that can be made.

Emigrant Gulch,

Thirty-five miles from Bozeman, was not visited, and we are indebted to Mr. Allen, of the *Avant Courier*, and others for a few facts.

About 50 or 60 claims are at work and said to be doing well. Miner's wages are $4 per day, and from 75 to 100 men engaged. One poor man was heard of who went in there three years ago, and who has realized about $60,000. Messrs. Cone & Lee have taken out a pile this year, with plenty of good ground left. Nash & Co., and all in the lower district have been successful. The Drain ditch company have also had a splendid season. Reynolds & Co., Wood & Long and Clifford & Co., of the upper district, had shut down on account of snow, but their purses were represented as considerably heavier than when they commenced work in the spring. It promises to pay better next season, as the claims will be better opened and will probably give employment to about 200 men. The mining of Gallatin county is not so extensive as that of Madison and some other counties of the Territory, the attention being given more to grazing and agriculture, in both of which respects it excels. A. C. K.

South Mountain District, Idaho.

EDITORS PRESS:—As the general opinion is on the outside that this camp is defunct, I will give you some items of the prospects outside of the Idaho smelting and mining company. The miners here are talking of forming a company of their own to erect a furnace and mill on a small scale, say five tons capacity, each to work their mines and run the machine themselves, for there is plenty of ore here that will justify them in so doing. In order to prove it I will describe some of them.

The Philadelphia Tunnel Company,

Owned by W. W. Hastings & Co. In running this tunnel the Black Giant was discovered 50 feet in, cutting the lode at right angles, the vein 12 feet in width and assaying $75 per ton and 45 per cent. lead. With the continuation of the straight tunnel in a southeasterly direction, about 250 feet, the Golden Monarch was discovered. This mine is six feet in width and the depth from surface 115 feet, the average assay being $154 silver and 58 per cent. lead. They have run on the line of the lead 22 feet, showing four and one-half feet of galena.

The Avenue

Belongs to Hastings Bros.; this mine has a shaft down 16 feet, the ore taken out at that depth is 20 tons, assaying $270 silver and 50 per cent. lead; vein, four feet.

Scandia.

This mine, owned by Don Vincent, has a shaft down 60 feet; ore on dump, about 80 tons, averaging $96 per ton silver and 40 per cent. lead.

Clipper.

The owners, Palmer Bros., have a shaft down 64 feet; width of vein from three to four feet; ore on dump about 40 tons; assays from $50 to $630 in silver, with an average of 20 per cent. lead.

The Mono

Is owned by Wm. Quail; shaft down 80 feet; ledge, four feet in width; ore on dump about 80 tons, of gray carbonate, galena and black sulphurets, assaying from $60 to $1,000 per ton, with an average of about 40 per cent. lead.

The Disappointment

Is owned by Wm. Rockefellow, the discoverer of the Virtue mine in Baker county, Oregon. It is about 90 feet in depth, showing a four-foot vein of splendid ore, assaying from $50 to $300 per ton in silver, with a small percentage of lead.

The Chronicle

Is owned by Vinton; shaft down 30 feet; vein small, from two inches to one foot; ore, gray carbonate and horn silver, assaying from $50 to $1,093 per ton, and 60 per cent. lead.

The Ruby

Is owned by Atkins, Connel and McLacey; shaft down 60 feet and a tunnel has been run on the line of the ledge about 60 feet, showing a four-foot ledge; about 75 tons on dump, assaying from $60 to $700 per ton, with 50 per cent. lead, and some of the ore showing native silver.

The Violet

Belongs to J. Smith and others; shaft down 20 feet, three feet between walls, showing native silver and galena ore.

The Mountain Chief

Is owned by Palmer Bros. and A. Brooks; shaft down 20 feet; three feet between walls, showing solid galena ore.

The general direction of all the mines is southwest and northeast, and dip to the southeast. The formation is principally lime, quartzite, mica, slate, feldspar, and in some places granite, syenite and gneiss.

Timber is plenty and any quantity of good ore in sight to make this camp self-sustaining. There is any amount of quartz here that will pay well for milling that has not more than from three to five per cent. lead, and no other base metal in the ore. The gentlemanly superintendent, Joseph Bowyer, is daily expecting orders from the company in San Francisco to start up their mines here, and if they don't start soon the prospect is that the miners here will increase their mining stock some.

November 22d, 1876.

Coal in Santa Cruz County.

EDITORS PRESS:—Sometime ago you copied from one of the local papers a statement that the Vulcan coal company, whose prospecting works are located on a branch of the Corralitos creek, Santa Cruz county, had made such discoveries of coal as to justify the expectation of early shipments to San Francisco. This statement was premature, as they had found nothing like a permanent lead until last week, when Mr. Wm. Strader, the indefatigable representative proprietor of the works, accidentally made the discovery of a vein of coal, which, if it continues to improve as it has up to the present time, will realize all that has been hoped of these mines. The indications of coal which induced the inauguration of these works, consisted chiefly of croppings on the north side of the creek and 15 to 20 feet above it. The croppings indicated a vein a foot or more thick, dipping at an angle of about 35 deg. into the mountain northward. A number of sacks of these croppings were sent to San Francisco last year, and tested with satisfactory results.

The company sunk a shaft 160 feet near this vein; at 150 feet they ran northward a level 225 feet, thinking to strike the main vein at the distance indicated by the dip at the surface. The perpendicular shaft is five by ten feet and the level five by five feet, all well timbered. All of the excavations have been in a friable sand rock, occasionally being hard enough to require blasting. All the coal indications at this depth were occasional patches of disturbed bituminous strata, showing that they were detached portions of the main vein, but in no manner pointing to the exact location of that vein. Owing to the great depth there was such an accumulation of water as to require the services of the hoisting engine several hours of the day to draw the water to the surface. For a while past the workmen in the drift were troubled with foul air, and it was found necessary to force down the shaft a current of pure air by some contrivance within the reach of the inventive genius of the parties. Some kind of a revolving fan was decided upon, and while seeking a board to be used in its construction, Mr. Strader discovered, in the hill on the south side of the creek, and about 40 feet above it, the croppings of the vein we have already alluded to. This vein has a dip to the south at an angle of about 50 deg., runs about east and west, and is near four feet in thickness. A shaft, four by five feet on the incline, has been sunk about five feet. It has improved every inch it has been sunk, and from thin layers of perfect coal at the surface, with considerable imperfect coal between, it has, at the present depth, thickened up its perfect veins to near an inch in thickness, with but little imperfect coal between. The vein at this altitude has a clay wall on its lower side, with sandrock on its upper. If this vein proves a genuine one, the date of its discovery will have been an epoch in the industrial interests of this county; for all these mountains have equal indications of coal, from Santa Cruz to the Pajaro river, and no doubt continue in the Gabilan range. Railroads will be built to carry the coal to market; towns and villages will be built all through and along these mountains. A home market will be created for most of the agricultural products of these valleys, and new life and impetus given to business in this region not known since the days of gold discovery.

Before closing we would state that this company have sunk shafts and run tunnels at several other places in this vicinity within the last two years, with about the same results as in the instance mentioned. The zeal that this company has manifested to open up this great interest is certainly to be commended; for men of less nerve under equal discouragements would have given up the enterprise, while no less energy and perseverance than has been shown could have achieved the present success. We shall watch the working of this vein for the next few weeks with a great deal of interest, and will keep your readers informed of the results. C. N. W.

Watsonville, December 4th, 1876.

Pacific Coast Railroad Items.

Advices from Yuma announce that the Southern Pacific railroad will be completed to that place by the first of February. The people of Arizona have waited long for this consummation, and are to be congratulated. We wait now to see what effect this latest improvement will have on the Arizona bullion shipments.

The Virginia and Truckee railway company have projected an extension of their line up into Carson valley. Indeed it is a mere question of time as to when the road will reach out to and through Douglas into Esmeralda, and so on, south and west, wherever the timber belt stretches and mines are developing. C. L. Anderson, surveyor-in-chief of the road, has started the survey. Mr. A. will keep along until storms put an end to work for the season. Judging from present appearances the line of road will be surveyed as far as Genoa before snow stops the party. Whether it is to be a broad or narrow-gauge road has not yet transpired.

The editor of the San Diego *World* has been examining the map and profiles of Crawford's survey for the Texas and Pacific railroad. Starting from San Diego the line runs through National City, thence crossing the Sweetwater through Telegraph canyon to the lower end of the Jamul valley; thence by Harbison's bee ranch to Cottonwood at the mouth of Bear valley; thence up Bear valley through Moreno canyon into the Matsequal chain of valleys, through which a decidedly light and easy line has been discovered, to the head of Laposa valley, taking the side-hill down, and, on getting up, taking the top of the mountain at the head of Miller's valley, running level on the crest and crossing Walker's summit, thence through Walker's River canyon to the head of Cariso canyon; thence through Cariso Creek canyon and Palm Tree Creek canyon to the desert; then straight across the desert to Yuma, shortening the distance materially—the maximum grade being two feet in one hundred. In excavating for the bridge at Yuma on this side of the Colorado river, a fine lead of silver and copper ore was struck by the excavating party, samples of which have been sent to San Francisco for assay.

The editor of the Bidwell *Herald*, a paper published at Camp Bidwell, Modoc county, in its issue of November 22d says: On Friday and Saturday we were out with the surveyors, who were running a trial line for a contemplated railroad, which has for its object to give Oregon an outlet by land both to the East and San Francisco. The party left the Central Pacific railroad at a point between Humboldt and Mill City, about 40 miles west of Winnemucca, and came in a northwesterly direction across the Black Rock desert and in to Duck Flat a little south and east of that place, thence through the canyon there into Surprise valley, traversing the whole length of the latter on its western side until it reaches Bidwell, where it takes a turn to the east, passing south and east of the town, thence direct to Mr. Clough's, at which point it makes a large bend to the west, keeping near the foothills and crossing the canyon on a trestle-work just above Mr. Brown's house, from which place its direction is southerly again, all the time ascending at an easy and average grade until at a point due west of the post they have attained an elevation of about 400 feet above the lake. From this latter point a distance of about six and a half miles is traversed by a meandering line which has not a few excavations and embankments, several high trestles and tunnels, until a small pond is reached near the road over Lassen's pass, where a large tunnel will be made through the mountain, its western outlet being at the level of Fandango valley. The eastern entrance to the tunnel is at an altitude of about 900 feet above the lake on this side. Before the main tunnel is reached on this side of the mountain, an eccentric feature in the line is noticed, it winding itself into a spiral, crossing a trestle work over a gorge and the second time crossing on the same trestle but above the former crossing. After leaving Fandango valley it passes through Goose lake, crossing the head of that valley, from there through Drew's valley and the Spragne river country to the vicinity of Klamath, which, owing to the lateness of the season, is as far as the party ventured this year.

Promising Enterprises.

The San Juan ridge is probably the richest and most extensive mining belt on the coast. From French Corral to Moore's Flat, a distance of about 20 miles, there is known to be an ancient river channel running, and openings made upon it at different points prove that it is very rich and very extensive. Some of the best mines in the State are located upon this channel. The various claims belonging to the Milton mining and water company, the American mine and a dozen others of perhaps equal merit, the extensive grounds of the North Bloomfield water and mining company, and the divers claims of the Eureka Lake company, including those at Moore's Flat, Relief hill, Bloomfield, consolidated claims at Colmahia hill, and lots of other claims along the line, the names of which have escaped our mind, are all located upon the same channel, and as yet they have been barely scratched. We suppose that old channel hides from the world, among its sands and boulders, tons of yellow treasure which will, at no distant day, become a circulating medium of the country. We are glad to learn that the claims on this belt being worked are all proving rich and paying well, and we are still further gratified to know that there is a prospect of extensive operations in that section in the near future. It is proposed to throw open a section of this field and put it in shape where capitalists can make a permanent and profitable investment without buying out a whole mine and being compelled to personally supervise and assume the responsibility of its proper management. We learn that several mining experts have been looking over the ground on the ridge with a view to correctly report upon the same, and when done, if their report is favorable, capital stands ready to be invested. Mr. James D. Hague is one of them, and we learn has given the country a very thorough examination. He will report soon, and we judge favorably, as any one will who ever sees that section of the country. We further learn that there is talk of consolidating the immense property of the Eureka Lake company, and placing a part of its stock upon the market, with a view to more thoroughly and systematically opening up a portion of the extensive auriferous deposits belonging to it. The company own ground enough to make 40 mines, each one of which would yield rich returns if opened. We hope that this rumor will prove to be true, as it will make times lively all over the county. We think it is a duty the owners of the Eureka Lake property owe to the county to perfect some arrangement whereby their ground can be opened. There is too much treasure lying idle there to be profitable. We are satisfied, too, that moneyed men would be eager to invest in an enterprise where the returns will be so sure as in any of the mining or water property proposed to be consolidated by the Eureka Lake company.—*Nevada Transcript.*

BELOW ZERO.—The lowest temperature in the Arctic seas recorded by Captain Ross in 1820 was 50 deg. below zero; by Dr. Kane in 1853, 70 deg.; by Dr. Hayes in 1861, 68½ deg.; by Captain Nares in 1876, 72 deg. A Russian traveler named Niveroff once registered 72 deg. at Yakoutsk, Siberia.

MECHANICAL PROGRESS.

Large Bell and Clock.

The English *Iron* says: The great hell for the new town hall was successfully cast at Loughborough a few days since. The size of the hell is seven feet five inches across the month, and about the same hight to the top of the canons. It will weigh about seven tons. The note is G, and we are informed that it has a wonderfully fine full note. The legend running round the sound bow is "Ring out the false; ring in the true," in antique characters. This hell stands fourth in England for size and weight, hnt certainly first in tone and power. The three larger bells in this country are "Ben," of Westminster; "Peter," of York; and "Tom," of Oxford. Messrs. John Taylor & Co. are the founders, as they also are of the celebrated Worcester bells. The bell is expected shortly to be hronght to Manchester, and hung in the lantern of the tower.

The monster clock by Messrs. E. Dent & Co., of the Strand and Royal Exchange, which has been in course of erection during the past six months at the south end of the Crystal Palace, is now completed and in working order. This clock is almost a counterpart of the great Westminster clock (which was built by the same firm), with the exception of the striking and chiming apparatus; and the dial is the largest ever yet constructed, being 40 feet in diameter, or nearly 1,300 square feet in area. The diameter of the Westminster clock is hnt 23 feet. The hands, with their counterpoises, weigh nearly a quarter of a ton, the minute hand measures 19 feet in length, and moves half an inch at every heat of the pendulum. The distance traveled by the point of the minute hand is nearly four miles a week. During 17 days of observation the variation was eight seconds only.

PRECAUTIONS IN BOILER EXPLOSIONS.—By the report of inspections made by the Hartford steam boiler inspection and insurance company for the eight months ending Sept. 1st, 1876, says the *American Manufacturer*, it appears that during that time the company made 10,959 visits of inspection, and examined internally 7,162 boilers. The number of examinations, internal, external and at the quarterly inspections, was 22,147. Tha dangerous defects discovered were something over 2,000, which seems a large number. Among the defects enumerated are 409 cases of dangerous fractures. These are found through the rivet holes, or along the edge of the outer or inner lap o. the sheet. They are also found in and near the furnaces of the fire-box boilers, and along nr in close proximity to the fire surfaces. Deposit of sediment is another fruitful cause of trouble; we find not less than 600 dangerous cases in this eight months' business. Water is kept from the plates of the boiler, they are burned, contorted and fractured, and become very unsafe. Another serious trouble is corrosion, of which there were found 285 dangerous cases of external and 70 cases of internal. 1,115 steam gauges were found defective, 277 of which were so unreliable in their indications as to be positively dangerous. Their variations ran from —40 to +50. Many were found varying from —10 and 13 to +18 and 24.

A STEAM LAMP.—At the recent meeting of the British Association, Mr. R. Lavendar, Kirkcaldy, read a paper descriptive of a lamp specially adapted for collieries, tha merits of which was that it gava a great light at a small cost. The lamp, as shown at Kelvin Grove museum, consists of a glass lantern 18 inches square, with a funnel 24 inches high. Into this is introduced a jet of steam, about one-sixteenth inch in diam ct r, the object of which is to create a partial vacuum in tha lantern. The consequence is, that the surrounding air is forced through the burner of the lamp, causing almost complete combustion of the oil. A very brilliant light is thus produced, which is increased partly owing to the products of combustion being continuously removed and a volume of fresh air being introduced. The results obtained from a four-inch wick had been equal to a light of upward of 600 sperm candles.

IMPORTANT STRIKE.—The whole of the spring making trades in Sheffield are now on strike. The men have been paid 2s. 9d. to 3s. per cwt., and have been able to earn from £8 to £11 per week each—the highest remuneration in the town for this kind of labor. A short time since the masters tried to inforce a reduction of 9d. per cwt.—equal to a decrease of 27 per cent.—but the men have refused to accept the reduction. The smiths, forgers, fitters and other branches are at a standstill, and the strike threatens to be a very protracted one. The men contend that they are not overpaid considering the nature of the work and the fact that they have to pay their own underhands. The strike is seriously affecting local trade and causing great inconvenience to manufacturers.

NEW 150-TON GUNS.—Though designe for 160-ton guns have been prepared, *Iron* says there are good grounds for believing that the English government have no serious intention of ordering any of this size to be constructed, they having been advised not to go beyond guns of 150 tons for general service. Several of these will be made within the next 12 months, and it is probable that they will be used for both the land and sea service.

Designing Machinery.

At a recent meeting of Scotch mechanics an address was delivered by R. B. Bell on "Designing Machinery." He noted that in early days, in designing machinery, the proportion and strength of parts to accord with the strains to which they would be subject were not so much decided by minute calculation as they were by comparison and experience. The result here was a great waste of material, placed in positions not required, as may be seen in the designs of some of our older engines and machinery. In time, competition has come and a better knowledge of the principles of design and construction, and proper calculation of the strengths and strains, and the more extensive use of malleable iron in place of cast iron, in many parts of the work, and the result has been that the framing of machinery is not now made to represent Gothic churches or Grecian temples, but every member of the machine is designed with the intention of containing only the proportion of iron due to its own requirements, disposed in such a manner as to combine all the materials in the best forms to suit the purposes intended. Attempts at architectural effect and all other unnecessary interpolations are abandoned, and the result is that in a well-designed engine or tool, the eye is never offended by any unmeaning or incomprehensible member. The meaning and arrangement of every part is understood at a glance, and excites admiration by the beauty of the proportions and simplicity of the details.

In the first place, no man can design a machine in such perfection as I have attempted to describe, unless he has a thorough knowledge of all the principles of the machine he purposes to design, is well versed in practical geometry and mechanics, has a practical knowledge of, and is able to calculate strengths, strains and forces, and to apply the calculation necessary to apportion the quantity and form of the material in the various parts of the machine, so as to produce the greatest amount of strength with the least expenditure of material. Besides all this he must be a good free-hand draftsman and have cultivated an artistic taste for form and effect; otherwise, although, from possessing all the other qualifications, he may produce a machine perfect in all its working parts, and properly proportioned, yet, for want of such a faculty, his machine will turn out stiff and ungraceful, and wanting in form and effect. It may at first sight appear absurd to say that the study of anatomy can in any way assist the mechanical engineer in designing machinery; yet, on reflection, it will be found to be a matter of no small importance. If the anatomical class and the dissecting room are now part of the recognized studies of the artist who aims at perfection in the mere depiction of the human frame, how much more so should it be his study whose aim it is to produce imitations of its actions? To exemplify this, let us consider that our whole aim, in the study of mechanical appliances, is to be able to design works which will simply exaggerate the power which we possess in our own bodies, so as to concentrate the power of thousands into a unit, and to create of ourselves automatons in brass and iron, to imitate the actions which are performed by the body of man himself. The human machine can dig the ground, can hammer iron, can spin, sew, weave, propel boats, lift weights, carry itself, or carry loads from place to place by land or water, can burrow deep into the bowels of the earth, and fetch water and minerals to the surface—all this can it do of itself, and has done, without the aid of machinery.

To effect this by machinery, we, in our rude way, imitate nature as best we can, supplying the places of bones and joints, muscles and sinews, hands and feet, by shafts and rods, levers, straps and bands, wheels, cranks and connecting rods, all of which in endless combination are required for the purpose of producing what the legs and arms and hands and feet of man effect by the admirable system of natural appliances with which they are furnished, whilst the system of the human body in giving power and vitality to its members is copied by the steam-engine and its generator; and what, after all, is the appearance of the most perfect of man's combinations of machinery, in comparison with the perfection of the human machine itself? Therefore I say that the study of the human body, which in itself is the greatest perfection of a mechanical machine that it is possible to conceive, should be a part of the education of the mechanician. The beautiful mechanical arrangements with which it is furnished, the manner in which they are put together, and the forms into which they are molded, are all studies which are well worthy of the investigation of the mechanic. Let us take, for example, the arm and hand of man, so accurately proportioned in the strength of their various parts, so wonderfully shaped for the multifarious duties they have to perform, and with all this adaptation to every conceivable requirement for which their services may be demanded, yet so beautiful and graceful in their form and proportions. It cannot, therefore, be amiss in us, as part of a liberal education, to include the study of that which it is our main end to imitate, and yet, which, with all our efforts, we can never equal. I think, then, I am justified in saying that the study of anatomy is not foreign to the requirements of a cultivated mechanic. What I say of anatomy applies equally to natural history; in fact to everything that has life and motion.

SCIENTIFIC PROGRESS.

Action of Alcohol on the Brain.

Mr. C. T. Kingzett read a paper before the British Association for the Advance of Science "On the Action of Alcohol on the Brain." He said the question of what became of alcohol taken into the system had been extensively studied. Thudichum was the first to determine quantitatively the amount of alcohol eliminated by the kidneys from a given quantity administered, and the result he obtained was sufficient to disprove the elimination theory then widely prevailing. Dupre and many others continued these researches, from which, according to Dupre, they might fairly draw three conclusion: 1st, that the amount of alcohol eliminated per day did not increase with the continuance of the alcoholic diet; therefore all the alcohol consumed daily must of necessity be disposed of daily, and, as it was certainly not eliminated within that time, it must be destroyed in the system; 2d, that the elimination of alcohol following the taking of a dose was completed 24 hours after the dose was taken; and 3d, that the amount eliminated in both breath and urine was a minute fraction only of the amount of alcohol taken. In 1839 Dr. Percy published a research on the presence of alcohol in the ventricles of the brain, and, indeed, he concluded, "that a kind of affinity existed between the alcohol and the cerebral matter." He further stated that he was able to procure a much larger proportion of alcohol from the brain than from a greater quantity of blood than could possibly be present within the cranium of the animal upon which he operated. Dr. Marcet, in a paper read before the British Association in 1859, detailed physiological experiments which he considered to substantiate the conclusions of Dr. Percy, inasmuch as they demonstrated that the alcohol acted by means of absorption on the nervous centers. Lallemand, Perrin and Duroy had, moreover, succeeded previously in extracting alcohol from brain matter in cases of alcoholic poisoning. But all these researches left them entirely in the dark as regarded the true action, if any, of alcohol on cerebral matter, and no method of investigation was possible until the chemical constitution of the brain was known. Thudichum's researches in this direction, together with some more recent and published investigations by Thudichum and the author, had placed within reach new methods of inquiry regarding the action of alcohol on the brain. In his research he (Mr. Kingzett) had attempted this inquiry by maintaining the brains of oxen, at the temperature of the blood, in water, or in water containing known amounts of alcohol. The extracts thus obtained had been studied in various ways, and submitted to quantitative analysis, while the influences exerted by the various fluids on the brain had been also studied. These influences extended in certain cases to hardening and to an alteration in the specific gravity of the brain matter. Water itself had a strong action on brain matter (after death), for it was capable of dissolving certain principles from the brain. These principles included cerebrine, myeline, and apparently a new phosphorized principle insoluble in strong alcohol, together with that class of substances generally termed extractives. At the same time the brain swelled and attained a smaller specific gravity; thus, in one case, from 1,036 it became 1,007. It was notable that water, however, dissolved no kephaline from the brain. Alcohol seemed to have no more chemical effect on the brain than water itself, so long as its proportion to the total volume of fluid did not exceed a given extent. The limit would appear to exist somewhere near a fluid containing 35 per cent. of alcohol. But if the percentage of alcohol exceeded this amount, then not only a larger quantity of matter was dissolved from the brain, but the matter included kephaline. Such alcoholic solution also decreased to about the same extent as water the specific gravity of brain substance, but not from the same cause; that was to say, not merely by the lose of substance and swelling, but by the fixation of water. Many difficulties surrounded the attempt to follow these ideas into life, and to comprehend in what way these modes of action of water and alcohol on the brain might be influenced by the other matters present in blood. From Thudichum's researches it followed that the brain must be subject to every influence affecting the blood, and it was probable that what was written above regarding the action of water on the brain was likewise true of an extraordinary water serum in life. But if the serum were rich in salts, those salts, by a power of combination which they had for the cerebral principles, would preserve the integrity of the latter. On the other hand, it was difficult to see how any of the matters known to exist in the blood could prevent alcohol, if present in sufficient amount, from either hardening the brain (as it did after death) or dissolving traces of the principles to be henceforth carried away in the circulation; that was to say, should physiological research confirm the stated fact that the brain in life absorbed alcohol and retained it, it would almost follow of necessity that the alcohol would act as he had indicated, and produce disease, perhaps delirium tremens.

The Fac Simile Telegraph.

We have formerly mentioned this wonderful invention of Sawyer and Smith. It is been adopted by the signal service bureau at Washington. The *American Manufacturer* gives the following account: There was in operation between the signal service section of the Centennial exhibition and the chief signal office at Washington, on a circuit about 150 miles long, an instrument which transmits by telegraph the weather maps of the signal service, heretofore produced only in Washington. These maps contain what are called the isobaric lines, or lines running through the points where the barometer stands highest or lowest, and they show as well the different areas of the country. It has hitherto been impossible to present these maps to the public, owing to the inability of the ordinary telegraph to transmit anything but words and figures. This invention reproduces the map entire, with its lines and figures. It is then lithographed and printed for distribution on the presses with which the signal office is supplied.

The method may be briefly described as follows: The map, or message, to be sent is first written upon ordinary paper with ink in which a little glycerine has been mixed; then hsfore the ink is dry it is sprinkled with some powdered shellac, which adheres to the ink. The manuscript is then passed between rollers, with the face against a piece of hot zinc. The latter takes up the shellac, and a negative is produced in shellac, the best non-conductor of electricity, upon zinc, a good conductor. This plate is then bent around a cylinder, which is rapidly revolved, while a metallic point connected with the conducting wire is held to its surface by a spring and makes a spiral line over the face of the cylinder. At the receiving instrument a similar point traverses the face of a similar cylinder upon which is placed a piece of chemically prepared paper.

As the transmitting point comes to the line of writing the receiving point makes a dot on the paper by decomposing the chemically prepared paper, and as every portion of the writing is touched by the transmitting point the result will be a *fac simile* of the original writing or device. To produce this result it is necessary, of course, that the two cylinders should revolve exactly together, as, if one should go faster than the other, the discolored paper would be a confused mass of dots. In this consists the great novelty of the invention. Isochronous motion of the cylinders is secured by magnet at the receiving station which at each revolution of the transmitting cylinder accelerates if too slow, or retards if too fast. It is believed that this invention will prove a valuable adjunct to the present systems of telegraphy, or may, with further improvements, supersede them.

SPECIFIC HEAT OF GASES.—M. M. Kundt and Warburg, says *Nature*, have determined experimentally the ratio of the two specific heats of mercury vapor, which has been supposed by chemists to consist of monatomic molecules. According to the Kinetic theory of gases, supposing the gaseous molecule to consist of only one atom, the relation of the two specific heats (as Clansins has shown) would be 1.666. The lower number obtained by experiment for several gases may probably be explained by the complete constitution of their molecules. The method here employed was to produce a sound in two glass tubes placed end to end, and containing, one mercury vapor, the other air. Having introduced powder into the tubes they observed the distances between the nodes of vibration. Applying the formula for the velocity of sound which includes the densities, temperatures, and the ratio of the specific heats, and taking as the value of this ratio in the case of air, the number 1.405, they obtain, for mercury vapor, the number 1.67, which may be considered as fully in accord with the number 1 666 furnished by theory.

VORTEX SMOKE RINGS.—At one of the recent *conversaziones* of the British Association, Sir W. Thompson exhibited the vortex smoke rings. A box of about three feet square has a circular hole of about six inches in diameter cut in its front face, and the back is covered by a piece of tightly stretched canvas or linen. The vapors of ammonia and hydrochloric acid are admitted to the box, which soon becomes filled with the white smoke of chloride of ammonium. A sharp but gentle tap on the canvas back drives out a puff of the smoke, which traverses the room in the form of a beautiful ring. So great a velocity can he imparted to these vortex rings that even when at a considerable distance they have sufficient velocity to extinguish candles. The experiment is remarkably simple, and with a little care in securing good ventilation it may be performed without injury to persons or things in a drawing room.

GOLD IN PYRITES.—M. H. Schwarz melts 100 grammes pyrites with 46.6 grammes fine iron turnings under a layer of common salt. Tha mono-sulphide formed is powdered, and attacked with dilute sulphuric acid in a gas apparatus, the sulphurated hydrogen being received in ammonia. The matter insoluble in acid is collected, washed, dried and roasted. It is then mixed with borax and about two grammes granulated lead, and the mixture melted in a muffle until the lead collects in a single globule floating in ferruginous scoriæ. This globule is detached and submitted to cupellation.

Mining Share Market.

Mining atocka have not been at all active of late, and the paat week has abown no change for the better. In fact, a considerable decline haa been apparent. In Ophir particularly "bedrock" prices have been reached: Tbia decline haa been more than a anrpriae to many generally poated operatora, for they were unable to detect any immediate canae for the very marked diminntion in price. It is atated, however, on the authority of a gentleman who is supposed to be on tbe inside track of this and other mines, that Ophir waa in muob better ahape, and that a veritable bonanza haa been diacovered on the 1700-foot level, which will be unfolded to an expectant public as soon aa convenient. The Gold Hill *News* saya, however, that the decline was due more to a cessation of the atrnggle for tbe control of Ophir than to any adverae circnmstance in the development a of the mine. The reports from Ophir are good, and there is said to be plenty of money in the treaanry. Mexican is also said to have a good development of ore awaiting the proper time to be brought to light. The great bonanza of tbe Consolidated Virginia and California continues ita regular munificent yield and monthly dividends, with plenty of rich ore in sight. The opening np of the mysteries of the 1700 foot level progreasea bnt alowly, owing to hot, foul air and other adverse circumstances. The water in the Savage and Hale & Norcrosa is being alowly hut steadily reduced, and in due time tbe active development of those long snbmerged lower levels will be proceeded with. Good work is being done in the lower levels of the Yellow Jacket and Imperial, with good prospects for valnable developments. Overman, Caledonia, Baltimore and Lady Washington are all showing new and important featnrea in the way of ore developmenta. In fact, the chances for ore strikes in the southern or Gold Hill aection of the Comatock are better than they have been for some time. Justice is looming np grandly, and not only yielding anlendidly, but showing more and better ore every day.

The last monthly dividend for 1876 of Consolidated Virginia waa paid thia week, making $12,960,000 for the year. The mine paid, from May to December, 1874, the snm of $2,592,000 in dividends. In 1875 it paid $11,448,000, and this year, $12,960,000; total since the bonanza waa atruok, $27,000,000. Thia ia a princely sum to disbnrse in two years and eight months. No other mine in the ocuntry has ever been able to approximate it in the same time, or even in its entire history.

Upwards of $900,000 in aaaeasmenta on different minea became delinquent thia month. The *quid nuncs* predict a rise in the atock market on acoonnt of the redaotion of interest which haa been or is being made by the banka. The Bank of California haa led off with the reduction and the other banks will no doubt soon follow suit. This is good for everybody else as well as the hrokera.

MINING SHAREHOLDERS' DIRECTORY.

OTH

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior in proximity to the mines mentioned.

California.

AMADOR.

GREENBACK CLAIM.—Amador *Ledger*, Dec. 9: The last clean-up made at Mace's mill yielded some $6,000 from about 90 tons of rock.

IRVINGS' CLAIM.—Irving Bros. opened up a claim last spring in the vicinity of Mace's mill. After taking out a quantity of ore, work was suspended. We are informed that a quantity of ore has been put through the mill, and yielded far better than the owners anticipated.

MONTERCHARD.—The Volunteer mill of five stamps and the Kearsing mill of four stamps are both running on Montarchard ore. There is enough rock out to keep them running several weeks.

VOLUNTEER.—This mine is being put in efficient condition. Steam hoisting works are being erected over the shaft. A good road has been made from the mine to the main road, to facilitate shipment of ore. It is the intention to increase the capacity of the mill to ten stamps.

LOYAL LEAD.—We mentioned that a vein of very rich decomposed quartz had been found on or close to the property of the Loyal Lead, between Amador City and Drytown. A number of miners started to work the vein on their own account, and were taking out large quantities of gold, when the Loyal owners got out an injunction, and compelled them to desist. Since then it has been suspected that the miners have taken out the quartz during the night time, to prevent which the company have placed a watch upon the ground. There is likely to be a contest for the rich vein between the Loyal Lead and the North Gover companies, both parties preferring claims thereto.

MONTEREAU GRAVEL MINE.—Treich & Belliard's mine at French hill is turning out well. The tunnel has been thoroughly repaired, and the workmen are now taking out the pay dirt in considerable quantities. The other day a nugget was washed out worth between $60 and $70.

ALPINE.

CONTRACT LET.—Alpine *Chronicle*, Dec. 9: Manager Chalmers has let the contract for building the new boarding house at the Exchequer mill to Perry & Duff, of San Francisco, who have just completed the I X L mill building. The new boarding house is to be 32 by 60 feet, two stories high, with wings, and will be completed in six weeks.

COMPLETED.—Perry & Duff, of San Francisco, have completed their contract for building the I X L mill building—and they have done a creditable job. The machinery is being placed in position, and it is the calculation to have the mill completed in two weeks.

WASHINGTON.—The Directors of this company will meet on Monday evening to organize. Work has been commenced on this claim and some very rich ore already taken out.

CALAVERAS.

HALL AND LASSEY CLAIM.—Calaveras *Chronicle*, Dec. 9: Favorable progress is being made in the quartz mine on the Middle fork of the Mokelumne, near West Point. A tunnel, already 300 feet in length, is being run to reach the vein, and it is expected that in a week or two the ledge will be cut. The tunnel will bisect the vein at the depth of 150 feet. A good deal of rich ore has been taken from the mine, through a shaft sunk from the surface, the quantity of water encountered putting a stop to operations. The tunnel will serve to drain the mine.

THE tunnel of the Glencoe Consolidated, situated to cross-cut two large veins, some 40 feet apart, is completed, and levels have been commenced on the east vein. The ore is of a uniform "ribbon" character, producing rich specimens. The west vein is 12 feet thick; the east vein three and a half feet. The company will build a large mill in the spring.

ANOTHER NEW ENTERPRISE.—Mr. W. W. Cook, notably connected with gravel mining operations in this vicinity, is about to open a hydraulic in the old "Morehouse claim," near the French hospital, a short distance from town. Preparations for piping are about completed, it being expected to have the claim in full operation next week. For extent of gravel mining interests Mokelumne Hill is outranked by only one or two towns in the State.

MACHINERY BOUGHT.—The parties who lately purchased the Tiger mine near Rich Gulch Flat, are making preparations for the erection of machinery. They have bought the mill at the Wolverine mine, and one of Asbury's big teams went up to haul it to the ground last Thursday. The boiler and engine will probably be new.

INYO.

AT WORK.—Inyo *Independent*, Dec. 2: Messrs. Broder & Moffat still have a force of men at work on the Uncle Sam mine, Sylvania district, and will continue prospecting operations during the winter.

REX MONTIS.—Manager Holt started for the Bay last Monday, having suspended work on the mine for the winter. He hopes to perfect arrangements so as to get back here in about a month and go to work in reconstructing the old Silver Sprout mill, and making all possible preparations for active and extensive work on the mine next summer. It is a conceded fact that there is enough high grade ore uncovered in the Rex Montis alone to keep the mill running to its full capacity all of next summer. This is only one of the several ledges in close proximity belonging to the same company, which, so far as outward indications show, are even more valuable than is the Rex Montis itself. Their situation is such that a tunnel, four by four, will cut them all (and most likely in one compact ledge) over 2,000 feet deep. This tunnel, to be run in soft, mineral-charged strata cross-cutting the ledges, is part of the programme for next season.

SUNRISE MILL.—Cor. Coso *Mining News*, Dec. 9: The machinery, etc., of the Sunrise mill is rapidly arriving and we will soon have everything on the ground. The building and mill sites are all graded and the building is in course of erection: Modoc is doing well, and very soon large shipments of bullion will also be made from Minnietta Belle, and we hope soon to add Little Mack to our number. There are several other companies incorporated in this locality which, I understand, will commence immediate operations after New Years, 1877, consequently we look forth to a speedy and bright future.

SANTA RITA.—Coso *Mining News*, Dec. 9: Mr. Wilkie Darling arrived here yesterday to fill the position of foreman of the Santa Rita mining company, and, for the present, will also act as superintendent. Mr. Darling will at once commence active work upon the mine and in grading for their furnace site, besides laying pipe from their springs, so as to be in readiness for the furnace on the arrival of the machinery.

DEFIANCE.—There is every probability that more effective operations are about to be inaugurated, and upon a much safer and better paying basis. There are now upon the dumps some 150 tons of well assorted ores, and nearly as much more in the mine which has been thrown down but not yet wheeled out. Altogether we think the Defiance shows better to-day than it ever did before, and we are satisfied that the deeper the explorations the more extensive will be the ore bodies be found and the quality of the ore enhanced, as in the case of the Cerro Gordo mines, which are now down to a depth of over 700 feet. The Defiance and all the mines in Darwin district are upon the same grand belt, and the formation is pronounced by the best judges to be identical with that at Cerro Gordo, consequently there need be no hesitancy in going down upon the ledges.

NAPA.

REDINGTON MINE.—Napa *Register*, Dec. 9: This mine continues to yield a handsome revenue to its owners, and produces large quantities of quicksilver. During the month of November 903 flasks were shipped via Napa and the steamer *Emma* to San Francisco, and from the 1st of December to date 321 flasks have been shipped, making a total since November 1st of 1,244. The quantity of quicksilver is reckoned at 90 pounds to the flask.

NEVADA.

CENTENNIAL.—Grass Valley *Union*, Dec. 12: We understand from the best authority that the Centennial mine of this place has now on the dump pile and ready for the mill about 75 loads of ore richer than any that has heretofore been taken out. The ore from this mine has never yet paid less than $100 per load. The next crushing will show big things. Saturday was the Centennial's pay day and something like the sum of $3,000 was divided up among the employees.

OPENING OF THE ALLISON RANCH FRANKLIN.—Monday was a gala day to the residents of Nevada county; for once more was revived the spirit of former years—the opening of a mine. At about 10 o'clock, everything being in proper condition, the whistle at the hoisting works sent forth the shrill announcement that the Allison Ranch Franklin had unveiled herself and gone forth to the criticism of the community. The Allison Ranch Franklin, after mature deliberation, thought it advisable to start up with only ten stamps to attest the validity of amalgamating in the batteries; if amalgamation in this manner proves a success they will immediately put ten more stamps. The stamps in use are of the average weight of 800 pounds, capable of crushing a ton and a quarter every 24 hours. Mr. Patrick Rogers has the entire control of the mill, and from his long experience at the Eureka and other mines everything will proceed satisfactorily to the owners of the property. John Ford has the control of the underground work, and that is enough to insure success. Martin Ford is superintendent of the company.

PAY GRAVEL.—*Foothill Tidings*, Dec. 9: The Godfrey company, which began sluicing out on Alta hill, a few months ago, for the purpose of opening one of the ancient channels known to exist there, reached the bedrock a few weeks ago and began drifting. On Wednesday of this week, we understand, they struck gravel, which turned out 75 cents to $1 each from several pans washed. The importance of this development to Grass Valley cannot be overestimated, as it is thought the deposit here will prove extensive, and likely lead to a better understanding of where the channel runs in other claims.

THE Monnier process is said to be working successfully on the bese ores of the Providence mine, near Nevada City. Mr. Ches. Grimes informs us that it is claimed up there that these ores can be closely worked by this process at a cost of not to exceed $6 per ton. Such being the case, there is no end to the richness to be unearthed in these parts.

CRUSHING as well as taking out rock is going on for the Homeward Bound mine, and next week some results may be known. The ledge is a fine large one in the south drift.

PLACER.

MINING ITEMS.—Dutch Flat *Forum*, Dec. 7: The weather continues dry, and the supply of water is limited. The various claims that were not entirely ready for washing at that date have had ample time and favorable weather for putting on any finishing touches necessary. The Polar Star and Southern Cross claims continue washing steadily in rich gravel. The Elmore Hill claim is washing and using water a few hours each day. Four powder blasts have been exploded, and the ground loosened thereby has mostly been washed away. It is the intention to work the banks hereafter in two branches. This claim is being very economically worked, and the gravel is rich. The Franklin claim is not yet washing, but work is being carried on. A large derrick is being erected, the main tunnel is being extended and powder-drifts are being run to be in readiness for a good water's washing. At Gold Run two claims of the Gold Run hydraulic mining company (limited) and the Indiana Hill claim are both being prepared for continuous washing. The Stewart claim, lying opposite the cement mill, at Indiana hill, which has been idle for some years past, has been fitted up and washing therein commenced.

HUMBOO MINES.—The Luke & Collins company are now working a large force of men, cleaning out undercurrents, canyons, etc., and are also working their hydraulic claims as usual, and obtaining handsome returns. The Peelar and Guler company have been hydraulicing for some time. The Davis & Doran company will soon have another run completed, as they have been washing for three weeks. The Sailor Bar, owned by a Chinese company, are working a large gang of Celestials, and are hydraulicing with two streams of water. From the extensive style in which they are working it is thought they are making big pay.

EUCHRE BAR MINES.—The Ross & Ford company turned off the water and cleaned up, on the 10th of October, with good results. Owing to a large increase of tailings in the river, which can only be removed by high water, it was found necessary to remove to a higher portion of the claim. At present the pipes are relaid and new flumes so nearly completed that water will be turned on and washing commenced in about five days.

BEAR RIVER MINES.—The Richie company are still drifting and washing, with good paying results. The Centennial company have made preparations to remain all winter. The Bartlett company have already shut down until spring. The Whipple company are highly elated over the big pay they are now getting. In extending one of their drifts through the rim rock they tapped a channel, which is said to be very rich. Numerous pieces are being picked up by the drifters, worth from $1 to $10. Present indications point to a bonanza.

SHADY RUN.—The Wild Yankee company, having completed a successful summer's work in their drift diggings, are now hydraulicing. The North American is now under full headway, and as they advance with their prospecting drifts the indications of an extensive paying mine are daily improving.

PLUMAS.

ITEMS.—Plumas *National*, Dec. 2: We learn that Mr. Richard Oliver sold one-half of his interest in the Pierson mine gravel claims near Nelson, one day last week, to Mr. Lanthier, of Sawpit Flat. Messrs. Cottingham and Chapman, of Indian valley, have discovered a quartz ledge in the new Montgomery district which pro-pects splendidly, and they think they have got a bonanza. Ah Sbune, who had the contract for digging the big cut in Jack's Golden Enterprise claim near Spanish Ranch, has finished the job in good style. Shune says he lost considerably on the contract, but will have his eyes open next time. Many new quartz locations are being made in the neighborhood of Indian valley, and numerous mining pateats therefor will soon be published. Some of the Chinamen on Grub Flat, near Meadow Valley, are said to be making $10 per day. The Light Bros. are having 25 tons of quartz hauled from their ledge above Taylorville to the Bonanza mill in the North Arm. They should have a small mill on that ledge and do their own crushing.

SIERRA.

GOOD PROSPECTS.—Yreka *Union*, Dec. 12: We are informed that the various quartz interests around Mugginsville are looking very well and that the various mines in that vicinity are excellent. The quartz in the stopes of the old Shepard mine, now being worked by A. M. Johnson is improving. Mr. Tomkins, who has a ledge there, is also taking out rich rock. Other parties are also taking out good rock, and from present indications the quartz mines in that vicinity will ere long furnish work to a large number of men.

SONOMA.

TAYLOR MOUNTAIN COAL MINE.—Sonoma *Democrat*, Dec. 9: We are glad to hear the most encouraging reports from the work in progress on this promising mine. The tunnel on this side is now into the hill about 150 feet, and night and day shifts are constantly at work. We anticipate an immense benefit to Santa Rosa from the opening of this mine.

TRINITY.

NEW CLAIMS.—Trinity *Journal*, Dec. 9: On Weaver creek, Messrs. Wallis & Cruthis are opening a claim in the point below the mouth of Democrat gulch. The point was worked to some extent by Powell & Knight, in 1850, by ground sluicing. As the boys will put a small "giant" on the claim, it will doubtless yield well. Hughes & Eddy are working a new claim on Trinity river, opposite Gerdes Bar. They have a channel with blue dirt, which we are told prospects well.

TUOLUMNE.

PIPE IRON.—Tuolumne *Independent*, Dec. 2: A large amount of hydraulic pipe iron, destined for the Philadelphia gravel diggings, above Columbia, has arrived in town, and is stored in the saddle-shop, formerly occupied by Charles Half. The iron will probably be made into pipe on the ground, in consideration of expense and convenience.

THIRTY-TWO pounds and seven ounces of gold was recently received in one lot from one of our quartz mines in the mountains, above Sonora.

Nevada.

WASHOE DISTRICT.

YELLOW JACKET.—Gold Hill *News*, Dec. 9: The new shaft is now down 185 feet. There is considerable seepage of water at the sides and bottom. The north winze on the 1710-ft level is down 40 feet, the bottom is very favorable ground. It is the intention to shortly start a drift from this winze to prospect the vein of ore out on the level above. The south drift on the 2040 ft level is also making good progress, and will reach and connect with the south winze some time during the coming week. This connection will greatly benefit the circulation of air in that section of the mine, and enable the running of cross-cuts and prospecting of the southern portion of the mine, all of which is in virgin ground, entirely unprospected by any of the drifts or cross-cuts that have yet been run on the 2040 ft level.

JULIA.—The main south drift on the 1600-ft level is in favorable vein matter. The face of the southwest branch of this drift, following the line of the ledge is the Julia ground, is in quartz and ore which assays from $8 to $25 per ton, which shows a steady improvement as the face is advanced.

BALTIMORE AND AMERICAN FLAT.—The main north drift on the 1050 ft level is advancing, the face is clay, quartz and porphyry, mixed. This drift is following the west or foot wall of the ledge. The north winze on this level is down 82 feet, the bottom still in quertz and ore. The upraise 200 feet south of this winze is up a distance of 205 feet, following the inclination of the ore vein. The streak of ore in the face of the raise still continues, and is of a very promising quality.

JUSTICE.—Daily yield, 300 tons of ore. The ore stopes on the 400, 500, 600 and 700-ft levels are all showing splendidly. The general aspect of all the ore-producing sections was never better than at this time. The various claims that were not entirely ready for washing at that date have had ample time and favorable weather for putting on any finishing touches necessary. The Polar Star and Southern Cross claims continue washing steadily in rich gravel. The Elmore Hill claim is washing and using water a few hours each day. Four powder blasts have been exploded, and the ground loosened thereby has mostly been washed away. It is the intention to work the banks hereafter in two branches. This claim is being very economically worked, and the gravel is rich. The Franklin claim is not yet washing, but work is being carried on. A large derrick is being erected, the main tunnel is being extended and powder-drifts are being run to be in readiness for a good water's washing. At Gold Run two claims of the Gold Run hydraulic mining company (limited) and the Indiana Hill claim are both being prepared for continuous washing. The Stewart claim, lying opposite the cement mill, at Indiana hill, which has been idle for some years past, has been fitted up and washing therein commenced.

HUMBOO MINES.—The Luke & Collins company are now working a large force of men, cleaning out undercurrents, canyons, etc., and are also working their hydraulic claims as usual, and obtaining handsome returns. The Peelar and Guler company have been hydraulicing for some time. The Davis & Doran company will soon have another run completed, as they have been washing for three weeks. The Sailor Bar, owned by a Chinese company, are working a large gang of Celestials, and are hydraulicing with two streams of water. From the extensive style in which they are working it is thought they are making big pay.

EUCHRE BAR MINES.—The Ross & Ford company turned off the water and cleaned up, on the 10th of October, with good results. Owing to a large increase of tailings in the river, which can only be removed by high water, it was found necessary to remove to a higher portion of the claim. At present the pipes are relaid and new flumes so nearly completed that water will be turned on and washing commenced in about five days.

BEAR RIVER MINES.—The Richie company are still drifting and washing, with good paying results. The Centennial company have made preparations to remain all winter. The Bartlett company have already shut down until spring. The Whipple company are highly elated over the big pay they are now getting. In extending one of their drifts through the rim rock they tapped a channel, which is said to be very rich. Numerous pieces are being picked up by the drifters, worth from $1 to $10. Present indications point to a bonanza.

SHADY RUN.—The Wild Yankee company, having completed a successful summer's work in their drift diggings, are now hydraulicing. The North American is now under full headway, and as they advance with their prospecting drifts the indications of an extensive paying mine are daily improving.

The iron will probably be made into pipe on the ground, in consideration of expense and convenience.

THIRTY-TWO pounds and seven ounces of gold was recently received in one lot from one of our quartz mines in the mountains, above Sonora.

Nevada.

WASHOE DISTRICT.

YELLOW JACKET.—Gold Hill *News*, Dec. 9: The new shaft is now down 185 feet. There is considerable seepage of water at the sides and bottom. The north winze on the 1710-ft level is down 40 feet, the bottom is very favorable ground. It is the intention to shortly start a drift from this winze to prospect the vein of ore out on the level above. The south drift on the 2040 ft level is also making good progress, and will reach and connect with the south winze some time during the coming week. This connection will greatly benefit the circulation of air in that section of the mine, and enable the running of cross-cuts and prospecting of the southern portion of the mine, all of which is in virgin ground, entirely unprospected by any of the drifts or cross-cuts that have yet been run on the 2040 ft level.

JULIA.—The main south drift on the 1600-ft level is in favorable vein matter. The face of the southwest branch of this drift, following the line of the ledge is the Julia ground, is in quartz and ore which assays from $8 to $25 per ton, which shows a steady improvement as the face is advanced.

BALTIMORE AND AMERICAN FLAT.—The main north drift on the 1050 ft level is advancing, the face is clay, quartz and porphyry, mixed. This drift is following the west or foot wall of the ledge. The north winze on this level is down 82 feet, the bottom still in quertz and ore. The upraise 200 feet south of this winze is up a distance of 205 feet, following the inclination of the ore vein. The streak of ore in the face of the raise still continues, and is of a very promising quality.

JUSTICE.—Daily yield, 300 tons of ore. The ore stopes on the 400, 500, 600 and 700-ft levels are all showing splendidly. The general aspect of all the ore-producing sections was never better than at this time. The ore is very rich in sulphurets and stephanite of silver and all of it carries a considerable proportion of gold. The mine was never before in so fine a condition for working, or assumed as prosperous a look as now.

CALIFORNIA.—Daily yield, 500 tons of ore, keeping the mills all crushing. The ore breasts and stopes never looked better or yielded a finer character of ore than they do at this time. The south drift on the 1600-ft level has been trimmed up, a track laid and is now in the best condition possible for a rapid advancement. The face is still in rich ore. Sinking the C. & C. shaft is making the best of progress considering the strong flow of water.

CON. VIRGINIA.—Daily yield, 850 tons of ore. The ore stopes are looking well and yielding good ore at all points. One great trouble, however, has been experienced for some time past in the very poor quality of the air on the lower levels. This has been entirely caused by the very dry, lifeless atmosphere that this portion of Nevada has been blessed with for the past three months. A large force of men have been employed during the week enlarging the drifts and trying to benefit the circulation of air on the different levels.

BELCHER.—Daily yield, 200 tons of ore. Sinking the main incline below the 1600-ft level is making fair progress; it is now down 140 feet below that point. The drain shaft is being sunk at the rate of 3½ feet per day. This shaft is now down 138 feet below the 1700-ft level.

OPHIR.—Daily yield, 220 tons of ore, keeping the Nevada and Santiago mills running to the utmost of their crushing capacities. There is little or no change in any of the ore-producing sections of the mine. The ore prospect recently struck in the west cross-cut from the bottom of the winze on the 1650-ft level continues to show a decided improvement.

BULLION.—The Alpha drift on the 2000-ft level is steadily advancing along the west wall of the ledge, the face in soft porphyry, intermixed with streaks of quartz. The connection between the main incline and the winze which connects the 1400 and 1700-ft levels was completed last Wednesday, giving a splendid circulation of pure air.

CALEDONIA.—Sinking the main shaft is being pushed forward with all the energy possible. The north drift on the 1100-ft level has cut through the east clay wall of the ledge, and is showing some fine quartz.

CROWN POINT.—Sinking the main incline is going forward at the rate of three feet per day. It is now down 39 feet below the 1900-ft level.

SILVER CITY.—It will take about a week to get the old incline properly repaired and put everything in proper trim for deep operations, not only in the lower levels, but below. The machinery is being put into working position at the top of the incline and will be completed ready to start up in a few days. As we have before stated, this engine is being placed where the old one used to be, in the old tunnel or adit, about 100 feet from the month, and the smokestack will find exit through the old upraise or incline which runs through from the tunnel to the surface.

KOSSUTH.—The north and south drifts on the 600-ft level are each steadily advancing in very favorable ground. The water is gradually draining in that portion of the ledge, so that cross-cutting the ore vein on that level can now soon be commenced.

LEVIATHAN.—Cross-cutting is progressing rapidly at two points on the 600-ft level, with very encouraging results. At the north end the vein is pitching very flat and swinging rapidly to the east. At this point ore streaks of a highly favorable character were encountered last night.

UTAH.—Sinking the main shaft is going steadily ahead at a very favorable rate of progress. The rock in the bottom blasts well, and the water gives no trouble.

LADY BRYAN.—The new pumping machinery is gradually accumulating on the ground and will all arrive at the mine by the last of this week, the last of it having already been shipped from San Francisco.

COSMOPOLITAN.—Continued improvement is noticeable in the north drift from the bottom of the winze, and the chances for a good and extensive ore development in that direction are very good.

OVERMAN.—The south drift on the 1200-ft level is steadily advancing toward the south line, the face in very favorable ledge matter.

SUTRO TUNNEL.—Hard porphyry continues to be the principal features encountered in the face of the header at the present time. It blasts well, however, allowing of good regular progress. Total length of tunnel this morning, 14,296 feet.

FLORIDA.—Sinking the shaft and developing the fine ore prospects recently encountered while sinking, will shortly be the order of the day.

HALE & NORCROSS.—The pumps are kept steadily running, and are doing good work. The water is gradually draining, and it is confidently expected that the mine will be completely drained in 60 days more.

GOULD & CURRY.—The erection of the new pumping machinery is being pushed with all the energy possible.

TROJAN.—The ore developments at the 300-ft level continue of a very fair character at all points. The upraise from the north drift on that level is showing better.

LADY WASHINGTON.—The main east drift or cross-cut at the 850-ft level is now in 217 feet from the shaft. The face continues in quartz and other ledge material of a very favorable nature, and a considerable body of water is coming in, not enough, however, to interfere with the work.

NORTH CARSON.—The shaft is now down to the 500-ft level. The bottom is in porphyry, clay and streaks of low grade ore. The indications for finding a good vein of pay ore are excellent, and the proper openings for exploring with that view will be made shortly. Everything is said about the mine is on a good footing for the winter.

NORTH CON. VIRGINIA.—Sinking the shaft is pushed energetically ahead, the bottom in the best of ground for working and making a good substantial shaft. The flow of water is considerable, but is easily handled by the pumps.

SAVAGE.—The pumps are holding the water well in check below the 1100-ft level, at which point a large water tank is being put in, and another heavy lift pump inserted. As soon as this is finished, men will be set to work to clean out and repair the drifts, preparatory to prospecting and developing the levels in the most thorough manner.

SUPERIOR.—The tunnel from the reviae is driving ahead lively. The rock in the face is pretty hard, but blasts and works well. No increase of water.

IMPERIAL CON.—The north winze has reached the 2135-ft level, at which point a station is being put in preparatory to starting a drift south to connect with the north drift on the same level from the bottom of the south winze. This will give a good circulation of air and enable the cross cutting and development of the ore vein on the 2135-ft level.

SIERRA NEVADA.—The north and south drifts on the 1700-ft station are each advancing steadily, and are both showing a favorable improvement in the character of the vein material penetrated.

MEXICAN.—The upraise on the 1465-ft level is still in very favorable quartz and ledge matter. A cross-cut is also to be started on the 1700-ft level, on the south line, to cut and prospect the ore vein at that point.

SCORPION.—Owing to the delay caused by the foundry not being able to furnish the machinery complete within the time specified, the new pumping engine has not yet been set at work.

DAYTON.—The north and south drifts on the 700-ft level are making the best of progress, both still showing improvement.

ALTA.—Sinking the shaft is making excellent speed, the rock in the bottom being much softer than for some time past. The flow of water is giving no trouble.

SILVER HILL.—Sinking the main incline is making good progress, the bottom in fair blasting ground.

PROSPECTOR.—The main drift west, at the 400-ft level, is now in 208 feet. The face is in ledge porphyry, with seams of clay and quartz.

CHOLLAR POTOSI.—Daily yield, 100 tons of ore. Sinking the combination shaft is making excellent headway. Nothing new.

WARD.—The flow of water at the bottom of the shaft gives some trouble. The erection and completion of the new hoisting works building is nearly finished.

MINT.—Sinking the shaft is being pushed ahead with all the vigor possible, the bottom in good blasting ground.

PHIL. SHERIDAN.—Sinking the main shaft is making all the headway possible, the bottom still in very favorable ledge matter.

NEW YORK.—The enlargement of the shaft and cutting out for the pump stations and hob pits in the new compartment of the shaft is making the best of progress.

WEST BELCHER.—The ore developments of the 300-ft level are turning out splendidly, showing better and more of it as the various openings are proceeded with.

BALTIC CON.—The vein matter in the face of the drift shows considerable improvement this week, better and larger streaks of low grade ore coming in.

ROCK ISLAND.—The details of the new pumping machinery are about finished, and its erection is to be pushed to completion in a very short time.

BEST & BELCHER.—Cleaning out and repairing the drifts and winzes on the 1700-ft level, preparatory to cross-cutting, is still going ahead.

EAST ALTA.—Sinking the shaft making fair progress.

MINERAL HILL DISTRICT.

AT A STANDSTILL.—Eureka *Sentinel*, Dec. 8: We learn that operations at Mineral Hill are at a standstill, in consequence of an order delaying the starting up of the English company's mill. The different companies have about 2,000 tons of ore on the dumps, and were expecting to be able to get returns for their summer's labor sometime this month. Messrs. Lockwood & Ayres will ship four tons of ore to the Winnemucca reduction works. This is from a pocket in the Bonanza mine, which yielded about 20 tons, assaying from $1,000 to $4,000 per ton. Other companies will doubtless follow their example, and the returns will infuse new life into that prosperous camp.

PALMYRA DISTRICT.

RELOCATION.—Gold Hill *News*, Dec. 7: Charles Willard, an old prospector, has relocated six parallel leads of quartz, in the Palmyra mining district, in company with George L. Schwab, of Virginia City, and Dr. J. C. Hazlett, of Dayton. All produce the finest character of quartz, which will probably pay for its reduction. The one most worthy of notice is the Aurora, specimens of which have been assayed by Conrad Wiegaod, of Virginia, showing $485.55 in gold and $4.90 in silver. These mines are situated about 10 miles from Dayton, in an easterly direction.

Arizona.

BULLION.—Arizona *Miner*, Dec. 2: McLean, Christman and those associated with them in the Silver Flake and Kit Carson mines are still taking out large quantities of splendid ore. Perkins & Co., of the Agua Fria smelter, sent in to C. P. Head & Co. on Saturday 3,200 pounds of base bullion from ore purchased of these parties.

Two large silver bricks, aggregating nearly $4,000, came in from the Aztlan mill this morning. The Peck company are now realizing something over $10,000 per week from ores worked in this mill, under the superintendence of Dr. Goodfellow.

MORRISON, superintendant Pinal smelting company, we are advised left San Francisco yesterday for Prescott and will be here in about a week. It is presumed that he will be prepared on his arrival to start up the works and begin to boil out the bullion. Certainly such is the wish of every one concerned, many of whom are impatient of the delay that has already occurred.

Montana.

ORE SHIPMENTS FOR THE SEASON.—Butte *Miner*, Nov. 28: The shipments of copper ore from Butte for the

Continued on Page 404.

The Engineer.

The Effect of Temperature on Iron Trusses.

The change in length in iron trusses caused by the change of temperature, is allowed for, as is well known, by placing rollers under one end of each span. Such a contrivance cannot be used with arches, and they consequently rise and fall at the crown as the temperature varies. The amount of play to be allowed is easily obtained by multiplying together the coefficient of expansion of the metal, the length of the span, and the number of degrees from the greatest heat to the lowest cold. It is found, however, that the allowance previously calculated is more than is needed, and the question arises which one of the above factors is in error. It is stated that the structure lags behind the air in temperature; when a thermometer in the open air is rising, one protected from the air and in contact with the iron will have a lower reading, and vice versa. During a long continued elevation or depression of temperature, we should expect that the two thermometers would give indications more nearly alike. The lower chord of a bridge which is covered or floored over on the upper chord, will be protected from the extremes of heat and cold, and the change of length will then be small. The difference in the amount of expansion of the two chords would have the effect of changing the camber, or causing the truss to rise and fall without alteration in mean length, The often observed fact that a bridge, even when at a considerable hight above the surface of the water, will so protect the river beneath as to hinder and sometimes prevent the formation of ice in winter, shows plainly that the covering ameliorates the temperature which would otherwise exist below.

Some few types of trusses are not internally strained by a change of temperature, but in others a change of shape from this cause initiates tensions and compressions in the different pieces, by which their lengths are modified. The resultant movement at one end may therefore be made of a variety of very small components which it would be difficult to trace out, but data from practical examples for given types of truss, would furnish a coefficient of expansion for use.

There is one other direction in which a reason might be sought for a less change of length in a bridge truss than is expected. The coefficient of expansion is not an absolutely fixed quantity, but increases with the temperature. In solids the increase between 32 degrees and 212 degrees, Fahr., is stated to be hardly appreciable, but for high temperatures the increase becomes a considerable quantity. This increase in the coefficients or expansion of bodies by rise in temperature is probably due to the distance between the particles being augmented with the heat, and their mutual cohesion being thus more readily overcome. The force exerted by an expanding or contracting solid may be measured by the power required to produce an equal change of length by compression or by tension. When a bar of iron of one inch in cross-section has its temperature changed 12 degrees, Fahr., its expansion or contraction exerts a strain equal to about one ton—that is, it will require a force of one ton to keep the bar at the original length. If then, the several pieces of a frame are under tensile or compressive stresses of some three or four tons on the square inch of section, and are thereby elongated or shortened—since the particles are separated to greater distances in the one case or forced more closely together in the other—will not the coefficient of expansion be less or greater than the one for the normal state of the metal under no stress, and correspond with that one which in the scale of temperature would be correct were the bar already heated or cooled to the same linear dimensions?

If this were a fact, we should expect that an iron arch would exhibit less sensibility to a given change of temperature with a heavy load than with a light one, or than the expected amount for a rib of the same span under no initial compression. The deflecting of the crown is easily measured. On the other hand the vertex of the curve of a suspension bridge cable ought to have a greater alteration of level for the same change of temperature.—*Iron.*

Tunnel Under the Hudson.

The work of excavating the tunnel which is to connect New York and Jersey City under the bed of the Hudson river, progresses slowly. The work was commenced in November, 1874, after extensive experimental borings down to the depth to be occupied by the tunnel. While occupied bricking the shaft, the Delaware, Lackawanna and Western railroad obtained an injunction stopping the work, and it was not until last month that the injunction was removed and the company enabled to get to work.

The depth of the shaft is a little over 70 feet, and the greatest depth of the water under which the tunnel will pass is 60 feet. The extreme grade is two in 100 feet descending from Jersey City, and then, ascending on the New York side, three in 100 for 1,500 feet, then two in 100 to the New York end. The borings already made show that the soil through which the tunnel will pass is, for the most part, of a tenacious silt, underlaid by sandstone. Near the New York shore rocks are encountered, and gravel, which is considered favorable for tunnel construction, not offering any serious difficulties to the builder, as would bare sand and mud. The tunnel walls will be constructed of brick and cement three feet in thickness and circular in form. The hight of the tunnel will be 24 feet and the width 26 feet. A double track will run through it, resting upon a stone ballast, five feet from the bottom. The walls will be painted white and lighted with gas. Heavy steel rails will be used, which the company have already prepared. Pneumatic tubes, gas, and water mains can run through the tunnel beneath the track, if desired, so that New York gas and water may be sent to Jersey.

Progress of the Channel Tunnel.

The London *Standard* says that the progress of this colossal work, so far as the English are concerned, is nothing. On the French side there has been quiet and steady onward movement on a small but useful scale. The dredgings of Sir John Hawkshaw on the French side were confirmed and enlarged by M. La Vallee and his staff some time ago, and a report made by him of considerable value in September last year. Since then, the English sea bottom of the channel has been sounded, and similar confirmations and extended knowledge obtained; and a boring has been commenced, and is just finished, at Sangatte, about six or seven miles west of Calais. This boring and its results are the latest attainments, and, as exact details are reserved for the second report of M. La Vallee, now in preparation, we must wait a little while to learn how far the French engineer has really advanced. What we know from a visit to the works at Sangatte is that the boring there was commenced on the upper white chalk at somewhat less than half its thickness, has penetrated the lower white chalk, and gone through about 66 meters of gray chalk identical in its beds and fossils and characters with the grey chalk on the English coast between Abbot's Cliff and Folkestone; and that it has further penetrated into the gault clay after passing a thin band of dark green upper greensand, the total depth of the boring—which was effected by the ordinary iron gouges and chisels—being 133 meters, and the diameter 24 centimeters, or about 9½ inches. We know therefore now, quite independently of the shore sections, the nature and mass of the stratum in which the tunnel is to be pierced, and of the beds immediately above and below it; and that although the thicknesses of all these diminish towards the French coast, yet they are of sufficient magnitude for the engineering requirements of the submarine tunnel; and this notwithstanding that the geological series underlying these beds, or those represented on the English coast between Hythe and Hastings, are all rolled up together in strata of only a comparatively few feet in aggregate thickness in the vicinity of Boulogne. Coupling with the exact details of M. La Vallee's last boring at Sangatte itself, Sir John Hawkshaw's previous boring midway between that village and Calais itself, and the boring there made in the marketplace many years ago for an artesian well, and the dip and inclination of these most important geological formations—the white and gray chalks and gault—will be accurately ascertained. All this, however, neither proves nor disproves the hostile theories which have long existed and still exist as to the occurrence of a vertical fissure along the whole median line of the English channel, and which discussion will only be really settled when the driftways of the tunnel itself are actually driven from the shores of both countries, and about to meet midway, under the bottom of the sea. That even this stupendous difficulty, if it really exist, will not be surmounted by the engineering skill of the 19th century we should be very loth to say. Nevertheless, every traveler by the fast mail steamers of the Dover and Calais line must certainly realize at every steamboat voyage the length of distance between even the nearest points of England and France; and, perhaps, may hope, if sensitive to the *mal de mer*, for the days of darkness and steam clouds under the sea in preference to the stormy winds and boisterous waves he has to endure upon its surface.

MEASURING THE CONTINENT.—Mr. George A. Fairchild, of the United States coast survey, is engaged in a transcontinental triangulation. The object of this survey is to determine the length of the 39th parallel from the Atlantic to the Pacific coast, and which will connect the surveys of the two coast lines. It will also furnish additional data for determining the shape of the earth's surface, and then all these triangulation points will give accurate data for the surveys of the different States. This will be the longest triangulation ever made in any country, the distance being some 3,000 miles. Eleven measurements of degrees for the determination of the curvature of the earth's surface have been made by other countries, of which nine only belong to the present century. The present triangulation across the continent was commenced several years ago. On the Atlantic coast the starting point was on the Chesapeake, and the triangulation is completed to Harper's Ferry, and from the latter point a special reconnoissance has been made to the Ohio river, striking it on the 39th parallel. Going east from the Pacific coast, Prof. Davidson, of the coast survey, is in charge of the triangulation from a point above San Francisco to the Sierra Nevada. Some three or four years ago the survey was started at St. Louis, working both ways to join the work from the east and west.

THE WATER SUPPLY AT WOOLWICH.—The water pumped from the artesian wells for the use of the troops at Woolwich, which, filtering through the Kent chalk-beds, is unusually pure, but also unusually hard, is now softened by adding to it a concentrated solution of lime, in the proportion of nine ounces to 40 gallons, which precipitates bicarbonate of lime, the hardening constituent. The lime water, if used pure, also coagulates and precipitates any dissolved organic matter. In four or five hours the hardness of the water is reduced from 21 degrees to six degrees, a result which could also be produced by the expensive process of boiling the water for two hours. The process works successfully, a million gallons being completely purified as easily as one gallon.

The Kroehnke Amalgamation Process.

Among the numerous special buildings situated west of machinery hall, says the *Iron Age*, is the one erected by the Republic of Chile, to accommodate a large, elaborate working model, serving to illustrate the Kroehnke amalgamation process. The model is very well executed, and is a copy in all its details of works at Antofagasta, Copiapo, province of Atacama. It is on the scale of one-sixth. The miniature engines which put it in motion are supplied with steam from an adjacent boiler.

The ore, which is, as we understand, both custom and purchased, is when delivered sampled. The sample is crushed in two pairs of rolls, and subsequently reduced to a fine powder, from which the material for the assay is taken. After sampling the ore is conveyed by means of a tramway to large cones lying in the rear above the crushing apparatus, into which its discharge is regulated by an automatic feeder, which, though its merits are not striking, possesses at least the advantage of being simple.

The crushing is effected a pair of wheels of 5,000 or 6,000 pounds each, rotating around a vertical axis in a trough. In the model there are six of these "trapiches," the capacity of which amounts to about six and one-half to seven tons per day, so that 12 are necessary for a mill working 75 tons. The power for such an output would foot up to about 70-horse power. The crushed ore is carried off from the trough by a constant stream of running water in the shape of slime, as it is considred imperative for the subsequent amalgamation that the ore should be in a fine state of division. The slime is allowed to settle in tanks, from which, after settling, the supernatent clear water is gradually drawn off as much as practicable. It is then dried, which in a climate like that of Chile is done by spreading it in the sun. The dry ore is carried to the amalgamating mill proper, and is charged into horizontal barrels of seven and one-half feet diameter and eight and one-half feet length, making from three to five rotations per minute. They are arranged in pairs, one on each side of the main line of shafting, to which they are directly geared. This arrangement does not permit the isolating of any one pair for the purpose of either changing its speed independently of the others, or of stopping it altogether. Therefore half the barrels at least must be charged and emptied at the same time, as the 24 barrels used are arranged in two sets of 12. They require 89 to 90-horse power, the same engine, however, sufficing to move other appliances to be mentioned hereafter. The capacity of the barrels varies, of course, according to the nature of the ore treated, but it may for ordinary rebellious material be placed at about 75 tons per day. The charge, varying from two and one-half to four tons, is mixed with a hot saturated solution of salt, until it has assumed the consistency of a thick paste, and then a saturated solution of subchloride of copper is added, this being the chief feature of Mr. Kroehnke's process, as it is destined to perform the chlorination of the silver, thus doing away with any previous delicate chlorination roasting process, which the European method of barrel amalgamation requires. Mr. Kroehnke prepares his solution of subchloride of copper by dissolving five per cent. of the weight of the ore in salt water, and by adding to it a solution of sulphate of copper of 20 degrees Beaume until saturation, and then heating the mixture by steam of three atmospheres. In order to prevent chemical changes he acidifies with sulphuric acid. The solution is considered fit for use when 50 c. c. poured into a liter of water becomes turbid from subchloride of copper.

The amount of solution used necessarily varies according to the amount of silver in the ore and the nature of the gangue. Clay and oxide of iron, which are indifferent, require less than, for instance, lime, which decomposes the subchloride. If there be more than one per cent. of antimony or arsenic in the ore a preliminary roasting is required; small amounts of the blende, copper pyrites or galena do not affect the results materially.

After having added the solution, the barrels are rotated for 10 to 12 hours, making about four revolutions per minute, at the end of which time the chlorination has been effected. In order to prevent a loss of quicksilver in the subsequent amalgamation by the formation of chloride of quicksilver through the agency of chloride of copper resulting from some of the chemical reactions during the period, metallic zinc or lead is added, which decomposes the chloride of copper. The same is done when docile silver ores containing horn silver are under treatment. An addition of 25 per cent. of lead silver in the ore has been known to have reduced the loss of quicksilver from 150 per cent. (?) to 25 per cent.

After the chlorination is complete, quicksilver in amounts varying from 20 to 25 times as much as there is silver in the ore is added. It is important that the mass should have the proper degree of consistency, so as to render a fine division of quicksilver throughout the whole possible. The barrels are again revolved for six to eight hours at the rate of three to five revolutions per minute, according to the nature of the material and its richness.

When the amalgamation is considered complete the whole is washed from the barrels and led through gutters into the settling apparatus, where the amalgam is separated from the slime by water kept in constant motion by revolving arms. The slimes pass off with the current of water, and the amalgam gathers in the bottom of the vessel, from which it is drawn. The liquid amalgam contains a large surplus of quicksilver, which Mr. Kroehnke removes by a centrifugal machine making 2,500 revolutions per minute, instead of filtering it through canvas, as is done in most mills. If the amalgam be white it is considered clean enough to proceed directly to distilling; if, however, it shows black streaks, indicating the presence of oxide and sulphide of copper, it is brought into two small barrels similar to the large ones, two of which are attached to every set of 12 In these barrels it is carefully cleaned by washing with hot salt water.

The pure dry amalgam is stamped into sheet iron cylinders composed of two parts, so that by drawing a bolt they may be easily removed, leaving a column of amalgam weighing from 1,200 to 1,500 pounds. It is conveyed to the distilling room, lifted by a crane upon a small car, on which stands a cast iron vat filled with water. The amalgam is placed upon a tripod standing in this vat. The sheet iron shell is removed, and the car run under a vertical wrought iron cylinder closed on the top. Its inside diameter is but little larger than that of the amalgam column, about 16 inches. The vat, tripod and amalgam are now raised by a simple contrivance, so that the two latter enter the cylinder, the lower end of which dips into the water for about six inches. We then have a vertical retort, closed at the bottom by water, and within its upper end the amalgam. The upper two-thirds of the retort is surrounded by a fire of charcoal or coke, inclosed within a cylindrical fire-brick furnace. The fire being started, the quicksilver of the amalgam distils, and its heavy vapors are condensed in the water closing the retort until after 14 to 16 hours the operation is finished. The silver is then lowered from the retort, the water poured off, and the quicksilver returned to the main mill, where, after having been used some five or six times in succession, it is found necessary to purify it by the addition of 20 grammes of Crooke's sodium amalgam to every 100 kgr. of quicksilver. Four retorts are deemed amply sufficient for the output of 24 barrels.

The metallic silver is remelted in a reverberating furnace and freed from arsenic, if present, by stirring with an iron rod. The silver is cast into molds holding from 70 to 90 kgr., placed on a car.

The whole distilling apparatus is so contrived as to be easily manipulated by one man, who may easily be controlled, thus avoiding the danger of loss by the pilfering propensities of the workmen, who are tolerably well aware of the value of the material which is being dealt with.

The chief feature of this process is the chlorination by means of the subchloride of copper solution, which, in most cases, when there is not too much antimony and arsenic, avoids any roasting whatever, and always evades a chlorination roasting, a difficult, costly and comparatively wasteful process, which, though very much improved by the introduction of several furnaces of recent date, has not yielded more than 95 per cent. of the entire amount of silver in the ore in the shape of chloride of silver. The process is said to be peculiarly adapted to the treatment of ores the chief gangue of which is calcspar, which in chlorination roasting would, if present in large quantities, require so large an addition of pyrites or sulphur for the decomposition of the salt as to make it practically impossible. Compared with the direct use of chloride of copper, the substitution of subchloride effects a very considerable saving of quicksilver, as has been proved by experience in Chile.

Mr. Kroehnke claims the process to be efficient also for the extraction of gold, but no data have come within our notice to warrant an opinion. It would be manifestly unfair to argue from the fact that in the European barrel amalgamation the extraction of gold is not so complete as in the Washoe process, that the same must apply to this process also. The losses of silver are asserted to amount to 1½ per cent.

Mr. Kroehnke has received an award both at the Chile exhibition at Santiago, in 1875, and at Philadelphia in 1876.

PROTRACTED TRANSFORMATION.—At a recent meeting of the entomological club of the American association for the advancement of science, Dr. Morris stated that three or four years since he had placed a number of cocoons of *Attacus Cynthia* on a shelf in his house, and that, after lying there all that time, some of them had this year produced the perfect insect. Dr. Hagen referred to an instance related by Kirby and Spence where a beetle (*Bopresis splendida*) was ascertained to have existed in the wood of a pine table more than 20 years.

Swamp Land Reclamation in San Joaquin County.

The reclamation of overflowed or swamp land in this county is perhaps being carried on to a greater extent at the present time than is generally known or appreciated, except to those immediately interested or employed thereon. Besides the work on Roberts island, by J. P. Whitney, Esq., which we have heretofore described, there is a greater and more extensive work going on in the reclamation of the adjoining island to the west, called Union island, by the Tide Land reclamation company, and known as Swamp Land district No. 282.

The district comprises an area of nearly 40,000 acres, requiring a line of levee about 45 miles in length. Work is now progressing on nearly all portions of this extended line, employing about 1,000 Chinamen, with a proportionate number of white foremen, carpenters and other employees, besides three engineers with their assistants in the field, with John Wallace, Esq., of this city, as chief engineer, and Capt. W. C. Walker as general superintendent.

The leveeing of this island will form a new era in the system of successful reclamation in this State. In most of the districts that have hitherto attempted reclamation, the work has been so imperfectly done that, after repeated breaks and overflows, doing an immense amount of damage and delaying the proper cultivation of the ground, it has been found necessary to enlarge the levee often more than once or twice before it became of sufficient size and strength to resist the attacks of the encroaching waters. But the company having the control of this district have adopted the better policy of building levees so strong and high in the first place as to preclude the possibility of future damage and loss of time.

The levees they are now constructing have an average base of 50 feet, with a slope of three to one on the side next the river, and two to one on the opposite side, with a hight of from eight to ten feet, and a width on top of five feet; these are the kind of levees built where the land is of a loamy character. Where the levee has to be constructed of the peaty turf common to the tule lands, it is made 45 feet base, 20 feet wide on top, with a hight of ten feet. The turf or sod of these levees is cut out in a regular shape and built up in the levees after the manner of brick work. These levees are placed about 200 feet from the bank of the river; the ditch from which the material is taken is between the levee and the river, and is from 120 to 160 feet wide and from three to four feet deep.

The machine invented by Col. A. W. Von Schmidt, the well known engineer, for pumping the mud out of the bottom of the river, to be used in the construction of levees in connection with the peaty sod, is in operation on a portion of the works. It would be difficult to adequately describe this machine, which displays great ingenuity in the adaptation of its different parts, and should be seen to be appreciated; but it supplies a want that has long been felt by all builders of levees, who must be satisfied that the tule sod alone is not a fit substance to be used in their construction, without the help or admixture of some more cohesive or compact material, which this machine is intended to supply, and apparently with satisfactory results.

The reclamation of Rough & Ready island, a small body of land embracing 1,600 acres, lying three miles west of Stockton, has been going on in a small way for years. The first settler on the island was James Crozier, who began building up the land for his extensive orchards over 20 years ago. He began on the principle of raising all the land above high water level, excavating earth from the interior of the island and wheeling it to the vicinity of the bank. This was of course a laborious and expensive process, although satisfactory in the end. But a few years ago the land included in the island, aside from the 160 acres owned by Mr. Crozier, was purchased by other parties, who surrounded it with a levee ten low and weak to be of any permanent service, as it broke with each succeeding freshet. The present year, however, they have awakened to the necessity of building high and strong embankments and since August 1st a force of 40 Chinamen has been constantly employed enlarging and strengthening the levee. From two to three feet have been added to the hight of the embankment, and the width has been correspondingly increased. The work will be complete in a few days. The island was flooded with water last winter, which has remained standing upon it throughout the summer until in August, when it finally evaporated, leaving the land in a condition ready for the plow. A few years will see the whole of this spot, now covered with tules, converted into a perfect garden. A portion will be put into wheat this year.

We are informed that the upper district of Roberts island, comprising some 20,000 acres, has been finally enclosed with a strong levee, sufficient in all parts to keep out ordinary flood water. Gangs of Chinamen are still at work, however, in different parts, strengthening weak places that are more exposed to the river current than others. The greater portion of the land has been leased and will be broken up for a crop this winter. It is Mr. Whitney's intention next year to double the size of the present large and strong levee, making it safe beyond a peradventure.—*Stockton Independent.*

Useful Information.

Good Roadways.

We are not aware that any system of road making where proper materials are available, is superior to the old method of McAdam. The following are the directions prepared by Mr. McAdam, and will doubtless be of value to many readers:

Stone is to be procured in some form in almost every part of the country, and a road made of small broken stone to the depth of ten inches, will be smooth, solid and durable.

The size of stones for a road should be that of a hen's egg, or a half a pound weight. It must be in due proportion to the space occupied by a wheel of ordinary dimensions on a smooth level surface: this point of contact will be found to be longitudinally, about an inch; and every piece of stone put into a road which exceeds an inch in any of its dimensions, is mischievous.

In repairing an old road no addition of materials is to be brought upon it, unless in any part it be found that there is not a quantity of clean stone equal to ten inches in thickness.

The stone already in the road is to be loosened up and broken, so that no piece shall exceed six ounces in weight. The road is then to be laid as flat as possible; a rise of three inches from the center to the side is sufficient for a road 30 feet wide.

The stones, when loosened in the road, are to be gathered off by means of a strong, heavy rake, with teeth two inches and a half in length, to the side of the road, and there broken, and on no account are stones to be broken on the road.

When the great stones have been removed, and none left in the road exceeding six ounces, the road is to be put in shape, and a rake employed to smooth the surface, which will at the same time bring to the surface the remaining stone, and will allow the dirt to go down.

When the road is so prepared, the stones that have been broken by the side of the road are then to be carefully spread on it—not to be laid on it in shovels full, but scattered over the surface, one shovel full following another, and spreading over a considerable space.

Only a small piece of road should be lifted at once; five men in a gang should be set to lift it all across. Two men should continue to pick up and rake off the large stones, and to form the road for receiving the broken stone, the other three should break stones—the broken stone to be laid on as soon as the piece of road is prepared to receive it, and then break up another piece; two or three yards at one lift is enough.

The proportioning the work among five men must of course be regulated by the nature of the road; when there are many very large stones, the three breakers may not be able to keep pace with the two men employed in lifting and forming, and when there are few large stones the contrary may be the case; in all this the surveyor must judge and direct.

But, while it is recommended to lift and relay roads which have been made with large stone, or with large stones mixed with clay, chalk or other mischievous materials, there are many cases in which it would be highly unprofitable to lift and relay a road, even if the materials should have been originally too large.

When additional stone is wanted on a road that has consolidated by use, the old hardened surface of the road is to be loosened with a pick, in order to make the fresh material unite with the old.

Every road is to be made of broken stone, without mixture of earth, clay, chalk, or any other matter that will imbibe water and be affected with frost; nothing is to be laid on the clean stone on pretence of binding; broken stone will combine by its own angles into a smooth, solid surface, that cannot be affected by vicissitudes of weather, or displaced by the action of wheels, which will pass over it without a jolt, and consequently without injury.

Flint makes an excellent road, if due attention be paid to the size; but, from want of that attention, many of the flint roads are rough, loose, and expensive.

Limestone, when properly prepared and applied, makes a smooth, solid road, and becomes consolidated sooner than any other material; but from its nature is not the most lasting.

Whinstone is the most durable of all materials; and, wherever it is judiciously and well applied, the roads are comparatively good and cheap.

Spontaneous Ignition of Lampblack.—Within three years, says the Boston *Commercial Bulletin*, there have been three shops destroyed in Massachusetts from lampblack. A hand, damp with perspiration, a drop of water, a bit of grease, or a sprinkle of oil, will create the combustion which will start the lamplack aglow like charcoal, and so ignite the package, and hence the blaze. In lampblack factories, while great precaution is taken to prevent fire, a rainy or sharp frosty day will start a dampness upon the inside of a window pane, and the flying particles of dust lighting upon this creates a spark, which, communicating with the pile, sends a glow of fire with wonderful rapidity through the galleries of the shop. In cleaning up the smoke galleries, if the men let a drop of perspiration fall into a pile, they instantly scoop up the lampblack in and about where it lodges, and carry it out of the house.

Peat Manufacture.

At a meeting of the English society of engineers a paper by Mr. Charles E. Hall, "On the Conversion of Peat into Fuel and Charcoal," was read. The *Colliery Guardian* says: The author stated that his object was to place on record the cost and value of peat fuel, and charcoal, to describe the best machinery and processes for producing them, and to draw attention to the superiority of ground charcoal for duet fuel in many metallurgical operations. The author first noticed the difficulties attending the working and manipulation of peat in its crude state, and briefly explained why certain methods of treatment had proved failures, and, by samples, pointed out the superiority of the system of condensation over that of compression. He then described the Lead company's peat works at Middleton-in-Teesdale, showing the lowest cost at which peat fuel can be made under favorable circumstances, and giving the cost of working and production per ton for the last four months. The author referred at considerable length to the drying difficulty, and made some suggestions for the improvement of the process, showing the fallacy of artificial drying. A new system—or rather an improvement on the existing system—of condensation designed by the author and Mr. Bainbridge, illustrated by diagrams and working models, was next brought before the notice of the members. The author described this operation as condensation by freely bleeding the peat, and this was stated to be very effectively done by the machine described, the samples showing how thoroughly the fibers had been cut up and disintegrated. This improved machine is intended for the production of the densest charcoal, fit for any metallurgical operation. Samples of finely-powdered charcoal, suitable for iron founder's blacking, were exhibited, also samples for sanitary and agricultural purposes. The continuous peat carbonizing process was explained by the author, and a cost sheet, showing the probable cost of manufacturing charcoal on a large scale, was given. A novel construction of common fire-grate, suitable for economically burning peat or other light fuel, was also described.

Good Health.

Typhoid Fever.

A. L. Loomis, M. D., in the *Medical Record*, says: It is difficult to determine the period of incubation, or length of time the poison must remain in the body before symptoms of the disease are manifest. The history of isolated cases would lead to the conclusion that the period varies from 14 to 20 days.

The next question that arises is, how does the typhoid poison gain admission to the human body? Undoubtedly there are two principal sources of infection, namely, the air we breathe and the water we drink. A large number of well authenticated histories have now established the fact, that this fever may be developed by gases which emanate from privies, sewers, etc., which have been the receptacle of excrement from typhoid patients, and also by drinking water from springs and wells which have become contaminated by matters from adjoining privies and cesspools. It is also now an accepted belief, or rather is regarded as an established fact, that water remains contaminated, though far remote from the point where it came in contact with a defective sewer or water-closet.

Soil pipes and sewerage may be defective for a long time, perhaps a year, or even longer, and no case of typhoid fever occur, when suddenlyan endemic of typhoid fever breaks out, and careful investigation shows that its development was preceded by the introduction of the excrement of a single individual sick with the disease.

It is the belief of some that milk can convey the typhoid poison, and there is evidence in favor of this opinion; but I think there is stronger evidence that the water in the milk, and not the milk itself, is the medium through which the poison is transmitted.

This poison has great vitality. Typhoid fever frequently occurs in the same locality year after year, when the surrounding conditions are favorable to its development. Those conditions which favor its development are more frequently present in the autumn than at any other season of the year, and for this reason it has been called autumnal fever.

Usually it makes its appearance in a locality, year after year, at about the same time; case after case is developed until entire households and neighborhoods become its victims. Individuals who come to care for the sick may contract the disease, and even persons who visit houses in which the disease is prevailing may afterwards develop the fever, contracting it, not from the sick, but from the infected atmosphere of the locality.

Age must be regarded as a predisposing cause of typhoid fever. It is much more likely to occur in young than in old persons. It occurs most frequently between the ages of 15 and 25, and is rarely met with in persons over 50.

There are also individual idiosyncrasies which seem to predispose to this fever. Some contract it upon the slightest exposure to the influence of the poison, while others, frequently brought in contact with it, through long endemics, escape. Again, an individual may have repeated attacks of typhoid fever. I have in mind a physician who had typhoid fever four times, the last attack proving fatal. A person who has had typhus or scarlet fever is not likely to have a second attack, but no such immunity follows an attack of typhoid fever. Whatever view we take of the exact nature of the typhoid poison, it has been quite conclusively demonstrated that the typhoid poison differs very essentially from that of other fevers.

From this brief review of the etiology of this fever, we are led to the following conclusions:

First.—That its development is independent of over-crowding, and that it attacks the rich and poor indiscriminately.

Second.—That it may be communicated from one person to another through the excrements which have undergone decomposition after their discharge.

Third.—That an endemic of typhoid fever only occurs where the air or drinking water of the locality has become poisoned by emanations from typhoid excrements which have undergone decomposition, and that, if the fever becomes epidemic, it is a circumscribed epidemic, and not widespread.

Fourth.—That the exact nature of the typhoid fever poison is still unknown.

Don't Worry About Yourself.—The *Journal of Health* says: To regain or recover health persons should be relieved from anxiety concerning diseases. The mind has power over the body. For a person to think he has a disease will often produce that disease. This we see effected when the mind is intensely concentrated upon the disease of another. It is found in the hospitals that physicians and surgeons who make a specialty of a certain disease are liable to die of it themselves; and the mental power is so great that sometimes people die of diseases which they only have in imagination. We have seen persons sea-sick in anticipation of a voyage, before reaching the vessel. We have known a person to die of a cancer in the stomach when he had no cancer, nor any other disease. A man, blindfolded and slightly pricked in the arm, has fainted and died from believing that he was bleeding to death. Therefore, persons in health, and desiring to continue so, should at all times be cheerful and happy, and those who are sick should have their attention drawn as much as possible from themselves. It is by their faith men are saved, and also by their faith that they die. If a man wills not to die he can live in spite of disease; and if he has little or no attachment to life, he will slip away as easily as a child falls asleep. Men live by their souls and not by their bodies. Their bodies have no life of themselves; they are only resources of life—tenements of their souls. The will has much to do in continuing the physical occupancy or giving it up.

Diphtheria Successfully Treated.—Dr. E. Chenery, M. D., Boston, Mass., cites a very large number of cases, 158 within his own practice, saved by the use of hyposulphite of soda. The dose of the hyposulphite is from five to 15 grains or more in syrup, every two or three hours, according to age and circumstances. It can do no harm, but if too much is given it will physic. As much as the patient can bear without physicking is a good rule in the severer cases. The tincture can be used in doses of five drops to a half drachm in milk. The amount for thorough stimulation is greater than can be taken in water. I usually give it in such doses as can be easily taken in milk, using the milk as food for small children. One fact, however, needs to be borne in mind, namely, the hyposulphite prevents the digestion of milk, and should not be given in less than hour from it. They may be used alternately, however, without interference, in sufficiently frequent doses. Judging in this disease as I judge in others, I am fully persuaded that the treatment I have so long used, and which has not failed me yet, will save nearly every case of diphtheria if seasonably and vigorously employed, and there is no reason why it should not do as well in the hands of others as in my own. In none of my cases have I used any alcohol.

The Disease Germs.—The germ theory of disease is pronounced upon by the members of a medical society as follows: That so far as inquiry has been made as to the results of the active principles in infective diseases, it is probable that in a certain number the matter is particulate or molecular in form, and in the instances named, in no sense a soluble substance. That in regard to the causes of septicæmia, pyæmia, puerperal fever, erysipelas, and hospital gangrene, and in cholera, small-pox, the carbuncular diseases of men and animals, of typhoid and relapsing fevers, and diphtheria, there is not satisfactory proof that they are necessarily connected with minute vegetable organisms. That the real nature of these causes is still uncertain.

New Febrifuge.—Dr. Brunnetti, of Constantinople, recommends the following mixture as being not only much cheaper but more efficacious than quinine in malarious fevers: Chloride of sodium, 12 grammes, (185 grains); carbonate of iron, one gramme, (5¾ grains); mix and divide into three powders. These three doses are to be taken in one day, one powder being taken in the morning, another at midday and the third at night. In order to prevent a relapse, one powder should be given every morning for eight days. He finds it also superior to other anti-pyretics in tuberculosis, in smaller doses than the above, but continued for a longer time.—*Chemist and Druggist.*

NEW ADVERTISEMENTS.

A. L. Fish & Co., Machinery, S. F.; Ashestos Coating, Salamander Felting Co., S. F.

BULLION SHIPMENTS.—Since our last issue shipments from prominent mines have been made as follows: Tybo Con., Dec. 3d, $8,620; Washington, Dec. 4th, 338 oz. of amalgam; Comanche, 5th, $6,402.22; Northern Belle, 7th, $12,008.43; California, 9th, $196,351.17—total for November, $1,256,516 79; Laopard, 6th, $6,900; Modoc, 8th, $5,500—total to data, $28,600; Manhattan, 8th, $11,870.24; Tybo Con., 8th, $8,558.33; K. K. Con., 8th, $4,000—total to data, $15,500; California, 9th, $196,-351.17—total to date, $11,256,516.79; Manhattan, 12th, $11,000—this month to date, $35,-341.28; Arizona, $2,349.95; Con. Virginia, 11th, $118,250.14; Tybo, 8th, $4,351.20; Modoc, 10th, 223 bars—total to date, $34,100; California, 12th, $78,936.57; K. K. Con., 11th, $3,750—total to date, $19,255; Northern Belle, 10th, $18,006.96.

TRADE MARKS.—The Commissioner of Patents has received a communication from the Commissionar of Patents of Great Britain, informing him that by an Act of Parliament, foreignars have been accordad the privilega of registering trada marks in that country upon the same terms as British subjects. Our Patant Office will hereafter registar trada-marks for Britisb snbjects upon the sama terms and under the sama regulations as those now prescribed by it, in accordanoa with the Act of Congress, for citizens of this country.

WORK has been commenced on the new shaft of the Virginia coal company in El Dorado canyon.

Dissatisfied Mining Shareholders.

The officials of several of the mining companies have not held their usual undisputed sway over the properties under their control during the past year. In a number of instances where business was not carried on in accordance with business principles, the stockholders took occasion to protest in a very vigorous manner. They not only asked for explanations, but where such were not satisfactory they took measures to kick the managers out, to put it plainly, and elect people to office in whom some confidence could be put. All this is very proper, and the only wonder is that it has not been done earlier and oftener. The year 1876 has not been a satisfactory one to the chronic trustee—he who waxes fat financially out of assessments paid by others. Such trustees and officials as have acted "queerly" have been overhauled and their transactions as far as possible brought to light. Unfortunately for them, in almost every case good cause of complaint has been proven. If the movement inaugurated this year is only kept up it may have the effect of weeding out some of the old stock whose business it is to "manage" mining companies, and it will without doubt keep such persons in wholesome fear of detection so that they will act more honestly in the future.

Several of the little struggles between managers and stockholders such as we refer to, are now in progress. We mentioned in our last issue that the "Sharon party" had come off victorious in the fight for officers in the annual election of the Mexican mine. There was a very strong contest at the time. On one side the old officers, who are representatives of Senator Sharon, the controlling genius of the mine, were struggling for re-election. The other aspirants were L. P. Drexler, of Virginia City, H. H. Noble and the McDonalds, of San Francisco, and several friends. The contest was a close one, and resulted in favor of Senator Sharon, owing to a point raised by his legal advisor, that under the provisions of the new code, no proxies could be given unless the possessor had been a bona fide stockholder for 10 days prior to the election. This point being sustained by the President, some 16,000 proxies held by the Drexler party were ruled out of the fight, and victory was then a comparatively easy matter for the Sharon representatives. Mr. Drexler intends bringing the matter before the courts, basing his hopes on what he claims is a loose wording of that section of the code bearing on the subject of the right to vote by proxy. He claims that the mine is not properly managed; that there is a rich ore body on the 1465-foot level which ought to be worked, instead of which the superintendent is drifting and prospecting around in every direction where there are no indications of ore; that the managers are depressing the stock to buy it in cheap. Section 312 of the Code says: "At all elections or votes had for any purpose there must be a majority of the shares subscribed capital stock, or of the members represented either in person or by proxy in writing. Every person acting therein in person or by proxy or representation must be a member thereof, or a bona fide stockholder, having stock in his own name on the stock books of the corporation at least 10 days prior to election." Mr. Drexler, referring to this, says: "Now, my point is this: that the above section of the Code is faulty. It says that a stockholder must have stock in his own name on the books 10 days prior to the election, but it fails to specify the amount. It might be one share, or it might be 10,000. Therefore, I contend that as I had a portion of my stock on the books as specified, I am lawfully entitled to the management of Mexican, especially as I came into the election with 50,376 votes."

On Monday evening last a number of dissatisfied stockholders of the Mansfield mining company met, 22,500 shares being represented, or a little more than one-third of all the stock. Mr. L. Diedring occupied the chair. A committee that had been appointed at a previous meeting to examine into the reasons for the late assessment, reported that they had, after considerable opposition on the part of the managers of the company, been allowed to examine the books. They found that the company is charged with a debt of $23,178, the entire amount being due to the President, who is also Treasurer, and that the present assessment is levied to pay this debt. They are convinced that there is plenty of paying ore now lying at the month of the mine, and can see no reason why it is not hauled to the mill, as the returns will more than pay off the entire debt. A committee was appointed to receive stock from any dissatisfied holders and deposit same in the Safe Deposit vaults, so that in the event of sufficient stock being handed in, the dispute could be brought to a successful issue. The committee will advertise their office and hours for receiving stock. The meeting then adjourned to await a report from this committee.

A meeting of the dissatisfied stockholders of the Lady Bryan company was also held on Monday evening. The report of the committee appointed at a previous meeting states that the committee waited upon two leading lawyers to ascertain the cost of a lawsuit against the present board of directors. The committee recommended the retaining of Mr. Lloyd; also, that the stock and proxies of the dissatisfied stockholders be deposited with the Collateral Loan and Savings bank, corner Post and Kearny streets, the owners taking a receipt for the same. They further recommended that an assessment of two and a half cents per share be levied on all dissatisfied stock to pay the expenses of hall hire and lawsuit.

Mr. Tarpey stated that 30,000 shares were in the name of Mr. McClintock, and that the Lady Bryan mine had been incorporated under the new Code, which provides that in order to permit stockholders to vote the stock must stand in their names upon the books of the company for at least ten days before the election. The following named gentlemen were appointed a committee to solicit proxies from stock brokers for the purpose of defeating the coming election: J. Tyler, J. McIntosh, D. Tarpey, M. W. Fox and Mr. Kitts. A member who had looked at the books of the company a few days before, stated that $195,741.36 clear profit, on assessments, were unaccounted for, and that the books were mutilated.

Another meeting of the same company was held on Wednesday evening. The committee appointed to compass the expulsion of the management of the mine made a further report to the effect that steps had been taken to secure all stock deposited in the Collateral Savings and Loan bank from sale under the last assessment. In case the present trustees are ousted the owners can procure the return of their stock at once. Another meeting will be held on Monday evening.

The Bostonian dissatisfied stockholders on Tuesday filed a report in the county court of a meeting held on Monday, when three trustees of the corporation were ousted. On the first of the present month, a majority of the dissatisfied petitioned Judge Wright to allow them to hold a meeting, and upon the prayer being granted, a meeting was held on Monday, at which there was 60,000 shares of the Boston stock represented. A. Carter was chosen chairman and John Stewart, secretary. James Brady offered a resolution to the effect that the meeting proceed to elect directors in place of A. P. Bacon, E. T. Bacon and S. W. Jones, who were by vote removed, and J. P. Cushing, John Stuart and E. C. Morton were substituted by a unanimous ballot.

Forward and high and low pressure. Light load, inward stroke.

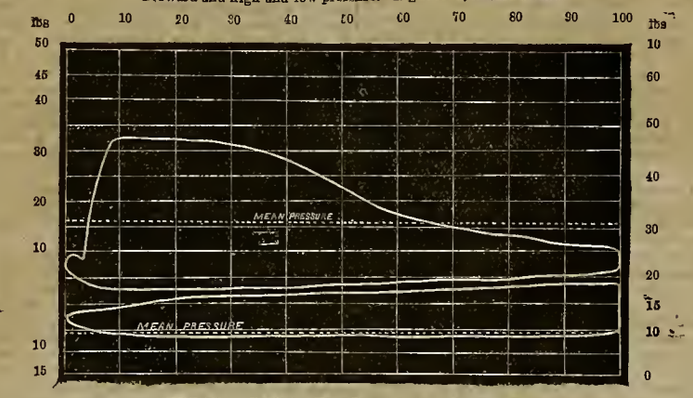

FIG. 7. CARD FROM ALTA ENGINE.

High pressure cylinder, mean pressure, 16 8-10 pounds; low pressure cylinder, mean pressure, 8 78-100 pounds. High pressure horse power = 1.86 horse power; low pressure horse power = 2.57 horse power. Total inward stroke = 4.43 horse power.

Backward and high and low pressure. Heavy load, outward stroke.

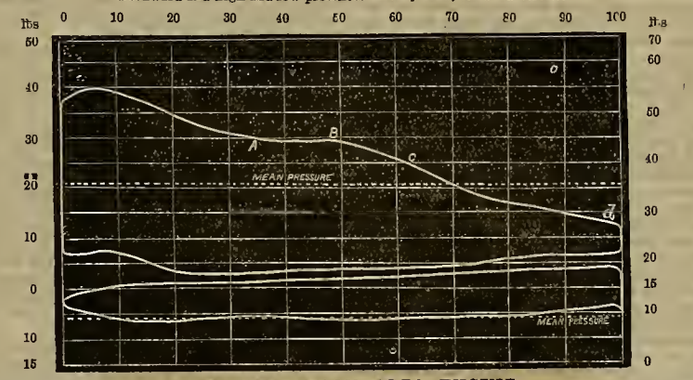

FIG. 8. CARD FROM ALTA ENGINE.

High pressure cylinder, mean pressure = 21¾ pounds; low pressure cylinder, mean pressure = 8 73-100 pounds. High pressure horse power = 2.43 horse power; low horse power = 2.65 horse power. Total outward stroke = 5.13. Total horse power indicated = 4.43 + 5.13 = 9 56.100 horse power.

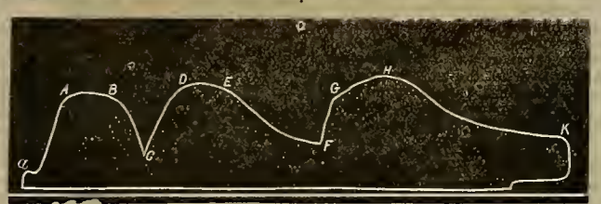

FIG. 11. SAFETY OARD FROM ALTA ENGINE.

Mechanical Ore Concentration and Separation.—No. 14.

[Written for the PRESS by FRANCIS M. F. CAZIN, M. E. Santa Fe, New Mexico.]

Ritter Von Rittinger.

This learned author was well acquainted with all the practices introduced, and he contrived to establish the physical principles on which all efficacious constructions were based. He also began to improve on different constructions on the basis of these principles, now put in the reach of every one by the publication of his book. Others followed, and the first consequence was, the general adoption of continuously and automatically acting machinery, where the manual help was reduced to the utmost and where human skill formerly was required in a high degree, simultaneously with hard manual work, the machinary had now to do the main work, leaving to human art only the regulation of machinary or the accommodation of proportions to the capacity of the machines.

I, therefore, believe myself justified in describing, extensively, only the few machines which have established their superiority by long practice.

As the first in the line must be designated the jigs selected in Europe for the most prominent mineral dressing works at Clausthal.

The Hartzer Jig.

[Mr. Cazin sends the full construction drafts of the four different kinds introduced for three different sizes of material and one for material of lower specific gravity. These drafts are copied from the official description of said works, edited by E. Kntscher in 1873.—EDS. PRESS.]

In the description of the Falun mineral dressing works, published in 1873, by E. Heberla, and lately translated from the German for the MINING AND SCIENTIFIC PRESS, by O. Rneger, these jigs are also stated to have had the preference in constructing these extensive and costly works.

As stated, the Hartzer jig is used in four varieties, each adapted to a special size or special material, and for a complete mineral dressing plant at least one of each will be required.

The Drainage of the Comstock Lode.

[Written for the PRESS by P. ARN. HUMBERT.—No. 2.]

Besides being injurious to the machinery, the cushion is shown to be costly, and it is for these reasons that it should be most carefully avoided, for tho benefit of the greater number of strokes is only arrived at with cost and danger. If more mass is acquired, the cushion must necessarily increase, so that with great depth it is a very serious mistake to use it.

Figs. 6 and 7 represent the diagrams of the Alta—Davey's differential compound pumping engine; diameter of high pressure cylinder, 27 inches; diameter of low pressure cylinder, 44 inches; five-foot stroke. At the time the diagrams were taken the engine was making 1.15 strokes per minute (double,) at depth of 520 feet. It is to be remarked that the shaft is being sunk, the most trying operation for an engine, the balance column is down but 300 feet, two rods and two columns of pumps, while the sinking pump, attached to one of the rods, throws the engine out of balance, especially when this pump takes air. The engine works with a directly attached condenser.

The energy of the mass is, in these figures, calculated the same way as in the preceding ones. The area above the mean pressure line, minus the area below the mean pressure line, ormed by the expansion, minus the back pressure, must equal zero. It will be remarked that the cut-off is not very decided, especially in Fig. 8, and that from the point *A* to *B*, an increase of pressure is noticeable; this is due to the automatic cut-off; before reaching *A*, the velocity of the mass was such as to require a cut-off to take place, but the engine having a light mass at the point *A*, the energy had decreased to such an extent as to require a fresh supply of power to finish the stroke, hence the opening of valve, the admission of more pressure to *B*, from whence to c and *d*, the regular expansion takes place. This proves the admirable working of the Davey differential valve gear when properly applied. Any person comparing the diagrams of the Alta with those of the Savage will immediately see the benefit of using expansion to stop the mass.

After having explained the part which energy plays in pumping machinery, we will examine the most important agent to control this force in a direct acting engine.

Davey's Differential Valve Gear.

This invention has three objects: to regulate the pause, to be an automatic variable expansion and to insure safety to the engine in case of a break in the rods.

The pause can be obtained by the usage of the old Cornish cataract, and a constant expansion, variable by the adjusting of the valves, can be attained, but an automatic variable expansion and safety can alone be arrived at by the invention of Mr. Henry Davey. Fig. 9 represents the valve gear at the end of the engine stroke. The pause cataract, *G*, is worked by the steam cylinder, *F*, and its speed is regulated by the valve, *R*, while the expansion and safety cataract, *I*, is rul-d by the steam cylinder, *H*, and its speed by the valve, *S*. *T* is a hand lever to start the motion. When the engine concludes its stroke, the cross-head, *A C*, strikes one of the tappets, *N* or *O*, opening the slide valve of the steam cylinder, *F*, causing it to make its stroke, at the conclusion of which the arm, *E*, strikes the tappet, *P* or *Q*, starting the slide valve of steam cylinder, *H*, which, by making its stroke, opens the valves of the main engines.

The cross bend, *A C*, is connected in its middle, *B*, to the valve rod of the engine; at *C* it is connected to a reduced motion through levers of the piston stroke of the engine, while *A* is attached to the piston rod, *K*, of the safety cataract. In opening the valves, the point *C* is the turning point for the lever, *A C*, while on the closing of the valves the point *A* answers the same purpose. The opening and closing of the valves are attained by the difference in the speeds of the points *A* and *C*, which move in opposite directions.

A too great speed of the piston therefore closes the valves, while a reduction of speed causes them to open. The expansion equal to the work performed will be attained by the speed of the piston increasing, and safety by the augmenting of this speed by removing the load. Should the speeds of *A* and *C* be equal, no motion will take place to cause the valves to open, and a too great speed of the piston will reverse them if necessary.

The diagram Fig. 10 demonstrates this more clearly. We will call *A B* the stroke of the engine and *C D* the stroke of the safety cataract, and we will put *A B* = *C D*, and also that the piston stroke of the engine shall be from *B* to *A* and that of the cataract from *C* to *D*.

We will suppose the engine to start at one-fourth stroke of the cataract and cut off steam at half stroke; further, we will not consider the lap of the valves and the radius of the connecting rod between the crosshead at *B* and the reduced engine stroke, shall of such radius as to make the arc described by *B* = *O*, or a straight line. When the cataract commences its stroke the point *d* connected with the valves is at zero, and the valves are closed; when the point *C* moves to *K* the point *B* will move to *I* and *d* to *f*, opening the valves a distance equal to *t f*, sufficient to start the engine. We will now suppose the speed of point *I* in reaching *G* to equal twice the speed of the point *K* to *L*, so that, irrespective of arcs described, the point *C* will reach *L* when the point *I* reaches *G*; this will require the point *f* to reach *i*, causing the valves to make the distance from *b* to *i* equal to *t* to *f*, consequently closing them. We will now first suppose that this acquired speed is such as to carry the engine to the end of its stroke at the same speed as the cataract runs; then, when the engine is at point *F* and the cataract at point *M*, the valves will be at c, consequently closed, and when the piston is at *A* and cataract at *D*, the valve will return to *d*, remaining closed. We will now suppose that when the engine reaches *G* she stops for want of power, and the cataract reaches *M* before she moves; then the point *G* will go to *G'*, and consequently the point *i* will return to *b'*, opening the valves a second time and closing them in the afore-explained manner. We now suppose that the work be thrown off the engine and that it reaches *E* while the cataract is at *M*; then the point *d* will go to *e*, making a distance *e t* = *a i* = *i b* = *t f*, consequently opening the valves on the reverse side and obliging the engine to make the contrary stroke, preventing by this means the piston's going through the head of the cylinder, therefore insuring safety to the engine. This shows how expansion and safety is automatically arrived at. It is to be remarked that the distance *C K* must be equal to the lap and the time to start the mass; the lap can be a fixed quantity but the time to start the mass is an increasing quantity with depth, consequently the speed of *C K*, being the speed of *C D*, has to be reduced, and this reduction is the same for *A B*, consequently the speed of the engine decreases with depth.

We will now suppose that the cataract has to travel from *C* to *D* before the engine starts, then the point *B* will go to *H*, causing the point *d* to go to *g*; consequently when the point *H* reaches *A*, the point *g* will have returned to *d*; in this case the valves will close at the end of the engine stroke, allowing no expansion to take place and removing all safety from the engine.

An engine made to run at too great speed and using a cushion will work in this manner. To this way of working direct acting engines, supplied with the Davey differential valve gear, is to be attributed all accidents, such as breaking of the cylinder head, etc., and not to the safety motion, which has no chance to work.

From the diagram, following rules must be complied with to insure correct working of the Davey motion. The engine must be calculated of such capacity as to work with expansion; in compound engines a larger expansion must be used than that existing by the relative volumes of the two cylinders. The valves should open quickly. A cushion of steam should not be used, as it reduces the safety. The speed of the engine should decrease in relation to the depth. It will be found that the want of safety which exists on most all the direct acting engines on the Comstock is due to the non-observance of these fundamental rules.

That the practical working of the Davey cataract agrees completely with the theoretical explanation, will be proven by the indicator card taken by myself from the Alta engine to ascertain the degree of safety the engine was working at; it is represented in Fig. 11.

The card was taken in the following way: The throttle valve opened so as to increase the speed of the engine; the safety cataract was slowed. The working of the valves was the following: From *a* to *A*, steam is let into the cylinder, the valves being open and the cataract ahead of the piston of the engine; at *B* the engine stroke over hauls the cataract, the valves close and expansion takes place; at *C* the speed of the piston is too slow for the cataract, consequently the valves reopen; from *D* to *E* the piston speed overhauls again the cataract and expansion takes place by closing the valves to *F*; the same play continues to *K*, when the engine concludes its stroke. It is at once clear that if the work had been thrown off at *C*, *F* or *K*, the expansion lines would have been continued down to the back pressure line, causing the engine to stop, or, if the energy of the mass had carried it beyond, the valves would have been reversed. This diagram removes all doubts as to the safety of the Davey cataract, when properly applied. It will be found, moreover, that the Davey motion is misapplied in most every case, so that accidents are to be expected at any moment.

It has already been remarked that the waters on the Comstock occur in variable quantities, so that the speed of the pumps must be such as to handle small as well as large quantities of water.

In direct acting engines, by the pause cataract the speed can be made much more variable than in geared engines, so that less stripping has to be done, reducing the consumption of steam when small quantities of water have to be pumped. This will be found a very desirable agent in reducing the consumption of fuel, and besides the other advantages of the direct acting principle, this is one not to be undervalued.

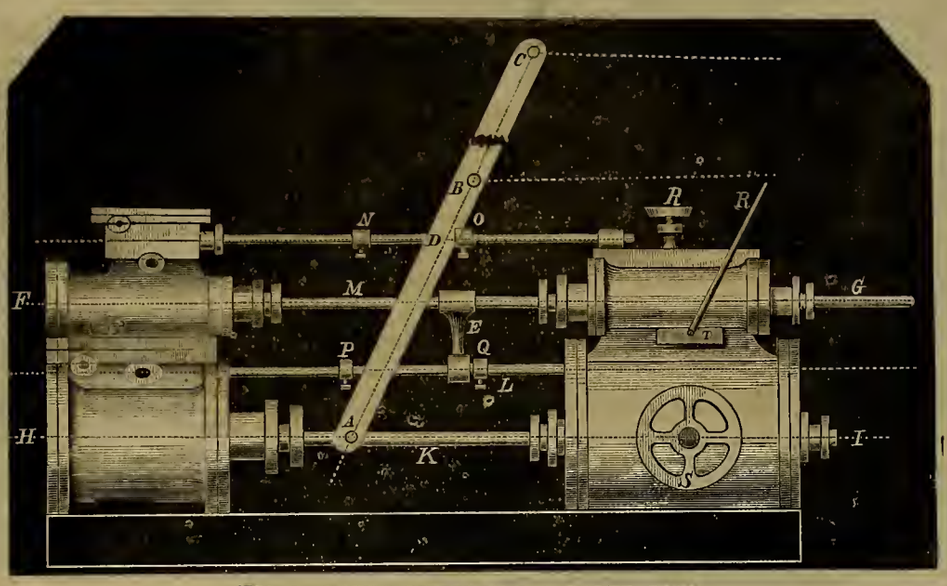

FIG. 9. DAVEY DIFFERENTIAL VALVE GEAR.

DIAGRAM OF DAVY'S CATARACT.

CUPRO-SCHEELITE.—At the last meeting of the San Francisco Microscopical Society Mr. Henry G. Hanks called attention to an interesting mineral which is only known to occur on the Pacific coast. It resembles scheelite, in which a part of the lime is replaced by oxids of copper. Prof. Whitney, who first described it, has named it cupro-scheelite. This mineral affords an example of the importance of the microscope in the determination of mineralogy. When first discovered it was thought to be a mechanical mixture of scheelite with some copper mineral; but upon a careful examination under the microscope it was found to be perfectly homogenous. Subsequent discovery of crystals of cupro-scheelite proved it to be a distinct and new species, as shown by the microscope. One peculiarity of this mineral is the ease with which the tungstic acid it contains can be isolated. Tungstic acid, combined with soda, forms tungstate of soda, the solution of which renders cotton cloth incombustible. It was suggested by Mr. Hanks that if tungstic acid could be produced cheaply, the theatrical managers could afford to prepare the cotton upon which their scenery is painted, and thus greatly lessen the danger from fire. Cupro-scheelite is said to occur in considerable quantities both in Upper and Lower California.

THE Arctic expedition still excites comment in England. The conviction is gaining ground that the outbreak of the disease of scurvy caused the break-down and return, after one winter in the Polar circle. The admiralty authorities are arraigned on the question of an inadequate supply of lime juice. The law compelling small trading vessels to carry anti-scorbutics has been disregarded by the admiralty, thus ruining the finest expedition ever equipped for Polar discovery.

A BILL introduced in Congress by Mr. Piper concerning the Black Hills country proposes the immediate creating and organizing of a territorial government for the region. He considers this very important, and, therefore, will urge a prompt passage of the bill.

MR. J. S. PHILLIPS, the well-known mining engineer and assayer, has removed his office from 640 Clay street to 504 Washington street. The new rooms are in the Government building and the laboratory, etc., are all fitted up in very convenient shape.

LEEDS DISTRICT, Utah, is now called the "Pioche extension" on account of that place being nearly made up of people from Pioche. A 10-stamp mill in Bullionville has been taken down for removal to Leeds.

Mining Decision in Relation to Tunnels.

The Right to Prospect for Blind Lodes.

GENERAL LAND OFFICE,
DEPARTMENT OF THE INTERIOR,
Washington, Nov. 3d, 1876.

Register and Receiver, Central, Col. Gentlemen:

On the 24th of Novemher, 1875, W. G. Pell, Samuel Cockran and John W. Nicholson filed in your offics an application for patent for 1,500 linear feet of the Slide lode, Gold Hill mining district, Boulder county, Colorado.

The notics was pnhlished in the weekly Sunshine *Courier* for the period of 60 dsys, to wit: From the 4th of Decemher, 1875, to the 12th of Februsry, 1876, inclusive.

The plat and notice were dnly posted upon the premises and in the Register's office.

By an abstract of title on file, from the office of the county clerk of Boulder county, Colorado, it is shown that said lode was discovered on the 26th of July, 1875, located July 30th, and recorded the 31st of July, 1875. It is also shown that said applicants have record title to the whole of said location.

The applicants have shown compliance with the law.

On the 20th of January, 1876, the Corning tunnel, mining and reduction company, by its President, Frederick A. Squires, filed an adverse claim against said application.

In his sworn statement, Mr. Squires alleges that he is the president of the said company: That said Slide lode is within the location of a tunnel site claimed by said company; that said Slide lode is a blind lode, and was discovered subseqnent to the location of said tnnnel site; that said tunnel site was located in accordance with the mining act of May 10th, 1872, and upon which said company has expended a large amount of money; that the rights of said company were acquired long prior to those of said applicants.

By a copy of the location notice, it appears that George C. Corning and three others, on the 18th of September, 1872, located snd recorded said tunnel site, and on the 14th of July, 1873, made record of a second location of said premises, dated July 9th, 1873.

In this second location, the tunnel is described as seven feet high, six feet wide and 130 feet in length.

It is also shown that said company has the record title to said tunnel site and location.

The applicants for patent have filed the sworn statements of John J. Scholes, Thomas Cryder, Daniel Drnmmond, Jehial Franklin, Smith E. Stevens and Burrell McPherson.

In his sworn statement, Mr. Scholes alleges that he was the discoverer of said Slide lode, that he was led to dig for and to discover said lode by the indications and outcroppings of the said lode on the surface; that they were very distinct and marked; that it was no hlind lode in any sense of the word; that it showed very plainly; that at the time of tbe application for the patent there was a tunnel run in on the lode 50 feet, and a straight shaft sunk on said lode at least 50 feet, and other outside work done, of a total valne of at least $2,000.

In his sworn statement, Cryder alleges that he is well acquainted with the Slide lode; that he saw the Slide lode ahout a month after its discovery, and very frequently since; that it is no blind lode, hut was discovered from the surface; that the outcroppings on said lode are qnite distinct and marked, and that good ore was obtained at tbe immediate surface.

Drnmmond, in his sworn statement, states that he is well acquainted with the Slide lode; that tbe croppings on said lode "are visible on the surface—situated in line—that there are several prospect holes on the said lode, and the aforesaid croppings are on a line between these prospect holes on the said lode; should say emphatically that the Slide lode was not a hlind lode, and that it was discovered from the surface."

Franklin, in his sworn statement, alleges that he is a practical miner, and has heen engaged in the business many years; that he was at the said Slide lode within a week after its discovery, and a great many times since; "that the outcroppings on said lode are so evident as to justify any one in digging for said lode, and that it was not a blind lode, and was discovered from the snrface."

McPherson, in his sworn statement, alleges that he is well acquainted with said Slide lode; that "he knows that the said Slide lode is not what is called a blind lode, hecause of the croppings of said lode plsinly appearing on the surface, and of its also being discovered from the snrface."

Stevens, in his sworn statement, corroborates the statements above referred to, to the effect that the surface indications and outcroppings conclusively demonstrate the fact that said lode is not a blind lode.

The fourth section of the mining act of May 10th, 1872—Revised Statutes, section 2,323—provides that "where a tunnel is run for the development of a vein or lode, or for the discovery of mines, the owners of such tunnel shall have the right of possession of all veins or lodes within 3,000 feet from the face of snch tunnel on the line thereof, not previously known to exist, discovered in such tunnel, to the same extent as if discovered from the surface, and location on the line of such tnnnel of veins or lodes, not appearing on the surface, made hy other parties after the commencement of the tunnel, and while the same is being prosecuted with reasonable diligence, shall be invalid; but failure to prosecute the work on the tunnel for six months shall he considered as an abandonmsnt of the right to all undiscovered veins on the line of the said tnnnel."

The uniform construction given to this section of the law hy this office is embodied into ths land office report for the year 1872, psges 60 and 61. As the construction therein given has heen followed, I embrace the same in this decision as showing the rights acquired by tunnel locations:

"The line of the tunnel is the width thereof, and no more; and that upon this line only is prospecting for hlind lodes prohihited while the working of the tunnel is in progress, and the right is granted to the tunnel owners to 1,500 feet of each hlind lode not prsviously known to exist, which may be discovered in snch tonnsl, but that other parties are in no way deharred from prospecting for hlind lodes or running tunnels so long as they keep without the line of the tunnel as herein defined, the said line heing required by regulations to he marked on the snrface hy stakes or monnments placed along the same from the face, or point of commencement, to the terminns of the tunnel line aforesaid.

"When a lode is struck or discovered for the first time by running a tnnnel, the tnnnel owners have the option of recording their claim of 1,500 feet all on one side of the point of discovery or intersection, or partly npon one and partly upon the other side thereof, hut in no case can they so record their claim as to absorb the actnal or constrnctive claim or possession of other parties on a lode which has heen discovered and claimed outside the line of the tunnel, hefore the discovery thereof in the tunnel."

The location nnder which said company olaim their title describes a tract of land 3,000 hy 1,500 feet and embraces more than 100 acres of land.

There is no authority for location of this size, either in the local laws or Congressional enactments.

It has always been the policy of the Government, as shown by the statutes providing for the disposal of the public lands containing minerals, to prevent an individual or company from acquiring title to large tracts of mineral land.

To recognize a location of the extent claimed by said oompany would he without authority of law and contrary to its expressed provisions.

The tnnnel location can only be recognized to the extent as authorized by law, to wit: Six feet wide and 3,000 feet in length along the course of said tnnnel.

Said adverse claimants filed a plat representing the conflict hetween said claims, oo the same day that said adverse claim was filed, to wit: Jannary 30th, 1876.

This plat represents that said tunnel, if projected, will intersect the said Slide lode at the distance of twelve hnndred and forty-three and one-half feet from the face of the tnnnel, and about two hnndred and twenty-five feet sonthwesterly from the discovery shaft on said Slide lode.

On the 4th of February a second plat was filed, which is certified to by the same depnty surveyor who certified to the plat filed on the 20th day of Jannary.

This represents the Slide lode in the same position with reference to said tnnnel that the first plat does. But an evident error appears upon this plat, in stating that it is nine hnndred and twenty feet from the face of the tnnnel to the intersection with said lode.

As hefore stated, the plat shows that the discovery shaft of the Slide lode is about two hundred and twenty-five feet southwesterly from the point whence the tunnel, if projected, will intersect said lode.

The papers seem to establish the fact that the Slide lode is not a hlind lode, hnt one which was discovered on the snrface.

The law gives to the tunnel owners only snch lodes as may be *discovered* in such tnnnel, and only prevents the location by other parties of lodes npon the *line of such tunnel*, "not appearing on the surface."

The adverse claim in this case was sworn to hefore A. J. Macky, Depnty Clerk of Bonlder, Colorado.

The applicants nrge that said adverse olaim was not verified in accordance with the Mining act of May 10th, 1872, and the Revised Statutes of the United States.

The Revised Statntes of the United States, section 2,335, provide that "all affidavits required to he made nnder this chapter, may be verified before any officer anthorized to administer oaths within the land district where the claims may he sitnated."

The honorable acting Secretary of the Interior, on the 28th day of October, 1873, in the case of the Dardanelles mining company vs. the California mining company, gave a constrnction to this section of the law, and rejected the adverse olaim, as the same had been sworn to before a Commissioner of Deeds for Nevada, in the State of California, and not hefore an officer anthorized to administer oaths *within* the land district.

This rule was also followed by the honorable Secretary of the Interior in the case of J. H. McMurdy, *et al.* vs. E. S. Streeter, *et al.*, April 30th, 1874.

The adverse claim in this case was not sworn to within the land district, and, under the decision of the head of the department, cannot operate as a bar to the issnance of a patent upon said application. Said adverse claim is accordingly rejected. Yon will inform all parties in interest and acknowledge the receipt heieof.

J. A. WILLIAMSON,
Commissioner.

Leeds District, Utah.

A correspondent of the Salt Lake *Tribune* writes as follows from Silver Reef City: Engaged as I have been for the past fortnight in inspecting the minss of this region and examining every foot of ground, entering every tunnel, shaft and "coyote hole," I cannot yet say I havs seen one-tenth of the mining ground in the vicinity. Vsry few men have done as mnch as ths three or four pioneers of southern Utah. For two years havs they struggled, and now they are about to see the realization of all their wishes.

During the past three weeks our city, now consisting of 250 or 300 hardy miners and hosinsss men, has sprung into existence, and where then nothing hut sage hrush could he seen, to-day we have the

Liveliest Town on the Coast.

Silver Reef City adjoins Bonanza City, and is situated abont one mile northwest of Leeds, at the head of the Pride of the West or White Reef, the richest and most extensive mine ever discovered. I say "mine," for althongh 15 locations, one adjoining the other, have been made, the entire reef is hnt one mine. It has heen opened at 20 different points, and the same ore is found all through it. The most thoronghly developed are the following; Lemon & Shephard, Bonanza, Barbee, Walker, McMnllin, Thompson, Mc Nally and McKelvey, which all show the best grade of ore, in veins averaging from one to seven feet—ore that rnns from $200 to $1,200. A new strike in the Bonanza of

Nins Feet of Ore,

sampling $874, was made on the 25th ult., and the owners are jnhilant.

The Barhee is shipping from 10 to 20 tons of $340 ore daily. A portion of this ore, however, is taken from the Tecumseh, whioh has produced the highest grade of ore, and is really entitled to the oredit of first attracting foreign capital to our camp.

The Thompson, owned by yonr townsmen, Dr. Thompson and Henry C. Bodley, is working three men and extracting from three to five tons of high grade ore daily. The Walker has a force of 15 men engaged in taking out ores.

The Leeds Mining Company's Mill

Is now *en route* from Pioche, and is expected to he in operation within 60 days.

John R. James is now negotiating for a mill, and expects soon to commence operations on a large scale. Two other companies also are endeavoring to bring in mills for custom work, and whichever comes first is sure to realize a fortune, as many thousand tons of good ore are awaiting the arrival of mills. We can easily supply half a score of 10-stamp mills with custom ores.

RECLAIMING THE COLORADO DESERT.—At a meeting of the Academy of Sciences, held this week, Dr. Wozencraft, the originator of the plan to reclaim the Colorado desert, was introduced and gave an interesting account of the scheme. According to his theory the desert was once a portion of the hed of the gnlf of California, but the depoaits hrought down from the mountains by the rivers formed a har that eventually cut off the waters at what is now the head of the gulf, and what remained was gradnally evaporated. The desert has been shown hy the snrveys of Lieutenant Williamson to he over 70 feet helow the level of the ocean, and by turning the waters of the Colorado into irrigating canals around the horders of the desert, the land can he utilized for agricultnral purposes. By thus reducing the temperature a rainfall will be caused over the desert and the adjacent connties of San Diego and San Bernardino in California. Dr. Wozencraft expects to obtain assistance from the Federal government in carrying ont his project, and has sent bills to be introdnced hefore the next Congress, providing means for prosecnting the work.

FOOTPRINTS.—The Pottsville *Journal* is informed of the recent discovory in the Ellangowan shaft of the P. & R. C. & I. Co., near Shenandoah, Pa., of Saurian footprints on coal slates of the Mammoth veins, and adds that these prove the existence of air-breathing animals in the tropical forests which formed anthracite coal, and of a mnch more recent date than those discovered by Prof. Isaac Lea, in the red shale rocks near Mt. Carbon hotel, about one mile south of us, and under the conglomerate rock which forms the basis of our coal deposits. We hope to have a full description of the above recent discovery, to be furnished to the Academy of Natnral Sciences, of Philadelphia, by W. Lorenz, Chief Engineer of the Reading railroad, who is in possession of the remarkable specimen referred to in this paper; he considers these discoveries the more remarkable from the fact that they are the only sign of animal life ever fonnd in the 400 square miles of anthracite, except one shell from the Raven Dale mines, and a few others from the deep shaft in Wyoming valley.

PARTICLES OF IRON IN ATMOSPHERIC DUST.—Mr. Tissandier has been examining various specimens of dust contained in atmospherio air, and finds that, in all cases and under all circumstanoes, they contain minnte particles of magnetic iron. The same particles are also found in rain and snow water, even in specimens taken from Monnt Blanc, at a hight of 2,712 meters above the level of the sea. Mr. Tissandier believes they are of cosmical, and not of terrestrial origin, and considers them to be remains of meteoric masses.

Tybo District.

A correspondent of the Eureka *Sentinel*, writing from Tybo district, says:

The mines are yielding more and hetter ore than heretofore, and as depth is being attained, the attrihutes ars fast becoming more discernihle. The usual quantity of ore is daily mined, extracted and dslivered at the furnaces; snd the various stopes and ore-hreasts of the different leads are yielding up their mineral treasures as ahnndantly as ever they did. The ledge is all that could be desired and the ore is heginning to exhibit a greater admixture of galena toward the deep than it did on the upper levels; so that, taken altogethsr, the outlook is unnsually promising. This is as it should be, for the

Tybo Consolidated

Company has been most prodigal in its outlay and it is but proper that it should have an equitable return from the large sums that have heen expended in placing the property in the fine condition in which we find it at present. Less than two years have elapsed since the smelting operations of the company were inaugurated with but one furnace of a 20-ton capacity. Now there are twa of a united daily reduction power of 50 tons. They are constantly employed in the production of hullion whose grade is not surpassed hy that produced by any other company on the coast. It is not often that we find base hullion to average $460 per ton in gold, silver and lead, as does the bullion molded in this camp. Taking this value of $460 per ton aa a basis for calculation, and the average has, I believe, heen higher, we find that the value of the bullion which has been made and shipped hence since the company first commenced to smelt, as I said less than two years ago, with one small furnace, gives an aggregate retnrn of nearly $850,000 in shining mint drops. Who will, after this announcement, impugn the prodnctive capacity of the Consolidated company's property? This, it will be noted hy the intelligent miniog operator, is no insignificant return when the obstacles and difficulties which always attend the first operations of any undertaking are properly taken into account. But though large the above sum is hnt a mere bagatelle com pared to what the futnre will prodnce.

The Better Times.

The hetter times, for which we had waited so long that we had almost become hopeless, seem to have dawned at last. Business is reviving. The spindles hegin to whirl again; the merchant has his customers; once more that which is produced finds a ready market; and once more there is labor for the workman, and bread and clothing and shelter for the lahorer. After the terrihle lesson we have received, it is a good time to talk about the futnre. Are we to go on again in the old way, and fill up, within a limited period of years, the old measure of foolishness, and tumble again into the old consequences?

It is not necessary that we should do so. We have, from mere necessity, begun to he economical. Let us continue so. Let us huild smaller houses; let us furnish them more modestly; let us live less luxuriously, and tune our personal and social life to a lower key. We have hravely hegun reform in public and corporate affairs. Let us ountinne this, and vigilantly see to it that our trnsts are placed in competent and honest hands. We are committed to a reform in the civil service—a reform which will extinguish the trade of politics, that haa done so mnch to dehauch and impoverish the country. Let us see to it that thia reform is effectively carried ont. Our cohhle houses have tnmhled ahout our ears; let us not reboild them. Our speculations lie in ruins, with the lives and fortnnes they have absorhed. Our fictitious valnes have been extingnished; let us not try to relight the glamour that made them. Our long credits and our depreciated currenoy have wrought incalculable evils; let us not continne them. Let us cease to deal in paper lies and pay in gold our honest debts. Above all, let us he content with modest gains, cease trying to win wealth in a day, and get something ont of life hesides everlasting work and worry. Fully one-half our wants are artificial, and these terrihle struggles for money are mainly for the supply of wants that we have created.—*J. G. Holland, in Scribner for December.*

WOODEN PAPER.—The mannfacture of paper from wood, which is getting to be an established industry, is accomplished by means of a process somewhat as follows; The wood of pine and fir trees (oak is of no nse whatever), is cut into small pieces a little less than an inch long hy half an inch wide and a third of an inch thick, which are then comminnted hy passing them into a machine very like a large coffee mill. It is then boiled, nnder a pressure of 10 atmospheres, in a solntion of oanstic soda for abont four hours. The residue is well washed, hleached, pressed, and lastly dried and ont up into sizes snitable for packing. It is also sent ont unhleached, in which form it is used for a variety of purposes, besides making brown paper. The greatest demand hitherto has heen in Germany and Austria, the former country producing, it is estimated, 250,000 tons of paper a year, and Austria 100,000 tons. If only one-fifth part of this he made with cellulose, that would mean 70,000 tons of this material, which would require 280,000 tons of wood for its prodnction.

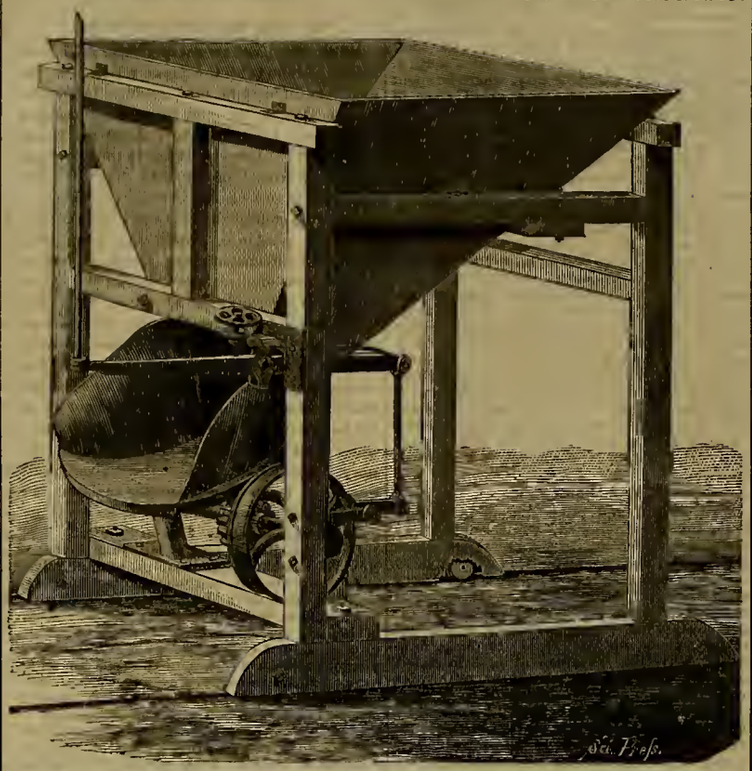
ANGELL'S CHAROOAL DENTAL SOAP for Whitening and Preserving the Teeth. J. W. ANGELL, Prop., San Francisco

$1,000 Challenge Ore Feeder,
AWARDED FIRST PREMIUM
At the Tenth Industrial Fair of the Mechanics' Institute.


It may be considered as now fully demonstrated, by careful and long-continued experimentation, that the plan upon which a perfect ore feeder must be constructed is that of the *carrier*, and not that of the shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane, or table, to the line of discharge, and there simply *dropped*. Spasmodic or jerky contrivances will not answer the purpose.
REFERENCES.
A letter received from the Julian Mill, Newcastle, says, of the Carrier Feeder: "It is the most perfect Feeder we have ever seen; don't see how any mill can do without them."——A letter from Mr. C. O. Belding, of Amador County, speaks in the highest terms of them.——Two of the machines were shipped to the Bunker Hill Mill, also Gover Mill, Amador County.——Mr. Stevenson, of Boston Mill, Gold Hill, Nevada, says they are the best Feeder he has ever seen.——Sonlsby Mill, Tuolumne County.——California Company, Nevada City.——Omaha Gold Mining Company, Grass Valley.——St. Patrick Mill, Placer County.

$1,000 CHALLENGE.
Backward in Coming Forward.
O. P. STANFORD FAILS TO COME TO TIME ON THE CHALLENGE OF $1,000 TO TEST THE MERITS OF HIS ORE FEEDER AS AGAINST MINE. THE CHALLENGE IS STILL OPEN TO HIM OR ANY ONE ELSE. *GENTLEMEN, PUT UP OR SHUT UP.*
A letter has been received from the Crescent mine, Plumas county, in which it states that the Tulloch is a failure as against the $1,000 Challenge Feeder of Hendy's.
We warrant the machines to give perfect satisfaction, and to be a better and more durable Feeder than any other in the market, and will sell them as cheap as any other of its class.

PAUL'S DRY PROCESS.
I am now prepared to test gold and silver milling ores in any quantity from TEN POUNDS to FIFTY TONS, and assert my ability to prove, by machinery NOW UP, and open to public inspection, and by practical testing of its merits, that I can increase the yield of gold mills, working wet batteries and copper plates, from FIFTY to ONE HUNDRED PER CENT., and on silver ores a much larger percentage than by pan amalgamation, and at less expense than any known method of working quartz well; and from some "gold" ores of California can extract more silver extra with the gold, which is now lost, than all the expenses of mining and milling. Having had 25 years' practical experience in milling gold and silver ores, I presume to know whereof I speak, and AM PREPARED TO PROVE ALL I ASSERT. These mills, for simplicity, cheapness practicability and perfection in working, challenge the skill of the age to surpass. Quartz miners who desire to investigate and have their ore tested, are invited to a critical examination of the machinery and process, and can receive permits for examination, particulars and pamphlets explaining process by calling at my office. ALMARIN B. PAUL.

Continued from Page 397.

sesson just closed have amounted in the aggregate to 1,300,000 pounds, of which the average per cent. of copper in these ores has been a little above 40, showing a value, at Salt Lake prices, of these ores sent to the States of nearly $5% 000. Independent of copper ores, there has been 700,000 pounds of silver ore, representing a value (estimated) of about $100 000, shipped to the East. These shipments combined, amounting up a thousand tons and showing a value of over $150,000—while comparatively light in comparison with older mining camps of other Territories, are, for a new place like Butte, a very encouraging indication of the growing prosperity of this section of the Territory, when taken in point of view with the shipments for the same time in the year previous, which were less than one-tenth, or about 100 tons of both copper and silver ores combined. To transport these ores to the railroad there has been paid to freighters during the season $35,000, or nearly 25 per cent. of their value. This heavy cost for moving ores a distance of less then 500 miles has prevented the shipment of hundreds if not thousands of tons additional of lower grade ores from this camp during the season, as after paying all expenses for taking them to a market, the margin of profit has been too small to make it remunerative for miners to send other than their high grade ores.

Colorado.

CASHIER.—Coloredo *Miner*, Dec. 2: It is reported on good authority that this valuable property is about to change hands at a fair price. With proper development it will doubtless prove a formidable rival to its neighbor, the Terrible.

RICH STRIKE.—Messrs. Egerton, Westfall & Co., leasing on the Steamboat lode, Leavenworth mountain, have struck it big. They are driving a drift east from the bottom of the 90 foot shaft sunk from the tunnel level, and at the distance of 40 feet have an ore streek of one and a half to three inches of ore, which runs from 1,500 to 3,000 ounces per ton. They have yet 100 feet to drift before they reach the surface, and we trust their luck will hold all the way.

STEWART REVIVUE.—It is pleasent to note the fact that the irrepressible J. C. Stewart has come up again, bravely as ever, rising from his ashes in better form than the fabled Phœnix. He has a neat little five-stamp mill, with leaching process (modified Hunt & Douglass) attached, in successful operation, and will be pleased to see his old friends and customers at the office once more. A large lot of Gilpin county gold ore has been treated lately with excellent results.

NEW LODE.—W. A. Campbell is now engaged in the development of a lode located about four miles northwest of Fall river, near Silver City, which makes a remarkably good showing for that district. At a depth of 150 feet, the vein carries from six to ten inches of ore, which runs one and a half ounces gold and 238 ounces silver per ton.

BOULDER CO.—Bonlder *News*, Dec. 2: Prof. Hill was in town yesterday, looking after the business of his large ore establishment here. It is now ready for business, bnilding complete, machinery set, and one pile of ore on hand—15 tons of the rich stuff from the Melvina. Than the establishment of this market, no more important step was ever taken in the advancement of Boulder county mining.

Oregon.

THAT RICH MUD.—Oregon *Sentinel*, Dec. 6: T. G. Reamea received last week, from H. B. Catman, of Portland, a can of the "mud" taken from the newly discovered silver mines on Crooked river, Wasco county, which now are attracting the attention of the people of Willemette valley, and about which there has been so much said in the newspapers recently. This discovery is said to be a number of boiling hot springs which continually throw to the surface a muddy substance resembling soap, and strongly impregnated with alkali, in which pure chloride of silver is found in such quantities as to assay from four to twelve thousand dollars per ton. The can which Mr. Reems received is one in which a pound of white lead had been put up, and the "mud" weighed exactly one pound, which shows that it is very heavy. We understand that 300,000 shares of stock in this mine, at ten cents a share, was put upon the market of Portland and was readily disposed of.

Idaho.

EMPIRE.—Owyhee *Avalanche*, Dec. 9: Work is progressing very favorably at this mine, and the developments are unusually satisfactory. There are 300 tons of ore on the dump awaiting crushing, and the parties engaged in running the mine are sanguine of very favorable results.

It is expected that operations will be resumed at the Poorman mine in a few days. With the exercise of some care and prudence in crushing the ore, that mine could be made a magnificent fortune to its owners.

ROCK is now being hauled from the Belle Peck mine for crushing at the Shoenbar mill.

SOUTH MOUNTAIN.—Some time ago Messrs. Vincent & Vinton sent 4,200 pounds of ore from two of the mines here to San Francisco, and are anxiously awaiting the result of the smelting thereof, as it will, in all probability, prove a good advertisement for the camp.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

FOR WEEK ENDING DECEMBER 5TH.

COMBINED HOSE-CART REEL AND IRRIGATOR.—Edward J. Delaney, San Jose, Cal.

DEVICES FOR PULLING FILES AND POSTS.—Richard Hillyer, S. F., Cal.

CLAMPS FOR WIRE ROPES.—Henry R. Taylor, S. F., Cal.

CAR TRUCKS FOR PRISMOIDAL TRACKS.—Edward B. Dorsey, S. F., Cal.

RULERS.—Charles M. Hays, Silver City, Idaho.

ENVELOPES.—Levi J. Henry, S. F., Cal.

CLAMPS FOR HOLDING HAND RAIL WREATH PIECES.—Christopher Lamb, S. F., Cal.

SPRING BED BOTTOMS.—Ambrose J. Lattin, Alvarado, Cal.

MINING RIFFLES.—August Mann, Big Oak Flat, Cal.

RE-ISSUE.

VEHICLE SEATS.—Frederick Oppenheim, S. F., Cal.

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

THE CASE of the Emma silver mining company (limited) of London, against Trenor W. Park, Henry H. Baxter and Wm. M. Stewart to recover $5,000,000 is on trial in the United States Circuit Court of New York.

Comstock Papers.

No. 12.

Emanuel Penrod,

Who owned, at one time, a sixth of the Ophir ground, besides valuable claims at Gold Hill, came overland from Illinois and settled in Washoe early, having prior to the Comstock discovery never been in California. He took up a ranch on Clear creek, a few miles south of the present site of Carson City, where he spent his time between cultivating a small tract of land and placer mining, which latter calling he followed on the bar at Chinatown, and along Gold canyon. He was among the first to obtain a foothold in the new silver mines, the value of which he seems to have appreciated from the first. Being, however, a cautious and prudent man, he disposed of nestly all his interests early, realizing only moderate figures for the same. For his one-sixth share in the Ophir, sold to Judge Walsh, he received $6,200. He remained on his ranch for some time and until it became quite valuable, when he disposed of it and removed to Elko county, Nevada, where for several years past he has been engaged in hydraulic mining, and, according to report, doing remarkably well. Penrod always enjoyed among his neighbors and those who had dealings with him, an excellent reputation for honesty and good sense. He was also a person of fine courage and superior business qualifications, being, in fact, a good type of the straight-forward, enterprising Western man.

V. A. Houseworth.

Like Penrod and other settlers in western Utah, this man, tempted, while on his way overland to California, to tarry and try his luck in the placer diggings along Gold canyon, or to turn aside and seek refreshment for his famished stock and jaded teams in the grassy valleys that lie along the foot of the Sierra, remained through the approaching winter and finally made up his mind to stop altogether, converting what was at first intended as a mere sojourn into a permanent settlement in the country. Houseworth came from western Pennsylvania, and being a blacksmith by trade, settled soon after he arrived in the country at Gold Hill, where he found profitable employment shoeing the horses and sharpening the picks of the miners. Being a man of intelligence, steady habits and good character, he was elected first recorder of the district. He owned in the Yellow Jacket and other claims about Gold Hill, and also one twenty-fourth of the Ophir, which last he disposed of for the sum of $2,000, Judge Walsh and Dr. Ober, an old and well-known resident of San Francisco, being the purchasers. The various mining interests which he parted with in 1859-60 for $3,000 or 4,000, would have brought him $500,000 or more had he held on to them a year or two longer. Having made a little "stake," which no doubt seemed to him a great deal of money, Houseworth returned to his old home soon after; and, although he came back to Washoe a few years later, he does not seem to have remained long. The probabilities are that he saw little opportunity, under the changed condition of things, for a man like him to further increase his "pile" or make another raise, and so betook himself again to a country where the chances for realizing a fair return for his labor were more certain, if not quite so tempting.

Naming the Mines—History of their Etymology.

In a majority of cases the names applied to the original locations on the Comstock lode require no explanation, the terms themselves, though in many instances wholly fanciful, sufficiently indicating their derivation and meaning. Of the 43 claims that may properly be referred to this class, 26 have been named in accordance with the rule here mentioned, 17 bearing the names of the parties who took them up or bought them from first hands soon after they were first located. Those at all conversant with this branch of etymological history need not be told how whimsical and even absurd are sometimes the primary reasons that operate upon the mind of the prospector when selecting names for his mining locations; hence the far-fetched and tautastical appellations so frequently given them. In the Comstock vocabulary this absurd style of nomenclature is not conspicuously apparent, the terms Ophir, Bullion, Exchequer, Challenge, Confidence, Empire and Imperial, as suggestive of certain ideas and properties, being appropriate enough; nor can any exception be taken to the remainder of this class, though not so happily chosen as the above.

The Allen and the Mexican Grounds.

We have already spoken of the fate of Allen, locator of the ground lying between the Utah and the Sierra Nevada, in which he was at one time largely interested and which still bears his name. The Mexican mine was so called after the Meldonado Brothers, two Mexicans who bought it in 1860 and afterwards worked the ores by the patio method, preparing at Virginia City an extensive yard with many arastras for the purpose. These were the only works ever erected in Washoe whereat this plan of ore reduction was practiced on a large scale. The Meldonado's were skilful miners in their way, working their ore more closely than was generally done by others at the time. They made money, and finally sold their mine to Alsop & Co. for a good price, after which they returned to their native country. This piece of ground went for a long time by the name of the Spanish claim, and is so designated on the earlier maps, the Mexicans being indifferently called Spanish, referring to the nationality of their ancestors and the language they speak, as the Americans are for the same reasons called English.

Another Mining Swindle.

The Silver Mud Springs of Oregon.

Within the past few weeks articles have been going the rounds of the press relative to the discovery of certain mud springs in Wasco county, Oregon, the mud from which assayed all the way from $300 to $12,000 per ton in silver. The "discovery" was in the appropriate neighborhood of Crooked river. There were said to be a number of boiling hot springs, which were continually throwing to the surface a mushy substance, resembling soap, and strongly impregnated with alkali, in which pure chloride of silver was found in such quantities as to assay up to $12,000 per ton. The bait seems to have taken, for only this week we notice that the Oregon *Sentinel* states that 300,000 shares of stock in one of the mines was readily disposed of in Portland at 10 cents per share; how much more was sold we do not know. We have refrained from mentioning this "find" while waiting for some verification of the story. Meantime, samples of the "silver mud" were sent to Prof. Silliman for analysis, and his reply, dated from New Haven, he gives us permission to publish. It is as follows:

I am this day in receipt of your favor of Nov. 25, covering a small sample of the "silver mud" from Oregon, and the clip from the Portland *Bee*, detailing in Munchausen style the wonderful find in Wasco county, telling of "acres of boiling springs, which, instead of water, flow streams of chloride of silver. Shiploads of precious metal are represented to be in sight in the shape of a soapy gray substance, somewhat resembling quicksilver. The molten masses bubble and boil with escaping gases. * * * About 160 acres are covered with these springs, ranging from a few feet to a hundred yards across. Each one is surrounded with a rim of crystallized silver," and more of the same wonderful narrative which need not be quoted, as any vivid imagination can make as much of such moonshine as may suit the taste.

But I hasten to inform you that I immediately put the marvelous mud, which you sent me, under examination. It is a light gray dry powder, quite fine, and resembles mill tailings or pulp when wet up.

Boiled with ammonia it yields not a trace of silver chloride.

Boiled with nitric acid it evolves red fumes and the filtrate treated with hydrochloric acid gives a copious curdy precipitate of silver chloride. From this reaction I was nearly certain that the silver existed in the metallic state in the pulp, and proved it beyond doubt, as follows: To demonstrate this a portion of the powder was separately washed by water in a test tube, and the successive washings decanted. The heavy residue was mostly white, with some angular fragments, quite small, and a few black grains like iron sand. This concentration examined by reflected light under a low microscopic power—two inch—at once displays a great number of pure white frosted masses which are opaque by transmitted light, resembling exactly the form taken on by silver when precipitated from solution by copper, or more closely the frosted lumps left by treating silver chloride by zinc and dilute sulphuric acid. To make sure of there being no optical deception, these masses, while yet in the fluid of the instrument, were treated with a dilute solution of ammoniam sulphide. They at once commenced to gain color, first yellowish, and finally dark brownish-black, leaving no doubt whatever of their nature. But any miner with his "horn" will at once solve this little riddle by washing a small particle of the stuff free of slimes and rubbing down the heavy grains in an agate mortar, or between two slips of glass, when the brilliant grains of polished metallic silver will at once appear as thin scales.

I am not surprised that Prof. Price found nearly $3,000 to the ton of this silver mud! It has plainly been very severely 'salted.'

Perhaps the honest miners who have made this very interesting 'find' will kindly tell us the curious chemistry of Waeco county, Oregon, by means of which thermal springs throw up metallic silver (and "crowbars" also!) and the nature of the escaping gases which cause "the molten mass to bubble and boil!"

Yours truly, B. SILLIMAN.

In verification of Prof. Silliman's opinion, a private letter was received from Portland on the same day as the report, (Thursday,) stating that the mud springs are reported a dead beat. Moreover, that they were salted by the same parties who not long since put up the job of base metal placer gold, purporting to have come from the Stickeen river mines. Some $30,000 in this bogus gold was sold in the British possessions before the fraud was detected. We have no means of knowing how much was made on the silver speculation. Lookout for a lead mine swindle next!

THE Wellington coal mines at Nanaimo, which were lately on fire, are again putting out coal at the rate of 140 tons per day.

New Publications.

From Bancroft & Co. we have received "English History in Short Stories." This little book is not a history of England. It is a compendium of facts about England, its history, government and antiquities—facts which all English-speaking people ought to know, and which are not readily accessible to those Americans who do not have good libraries at hand. It also contains a series of sketches of each of the English monarchs; not histories of their reigns or complete biographies, but estimates of the historical importance of each. As an appendix to the work are published brief descriptive sketches of the countries of Great Britain and Ireland. The facts are given in a condensed form and the little book forms a very convenient and pleasantly written hand book on the subject of which it treats.

"Theoretical Mechanics," by W. Rossiter, is No. 6 of Putnam's Elementary Science Series, (Payot, Upham & Co). This is an elementary hand book on the subject, with 145 diagrams. The main purpose is to explain, in simple language, so much of the science of theoretical mechanics as is deemed necessary. "Applied Mechanics," by the same author, (No. 7 of the series), is, as the title indicates, supplementary to No. 6. Both are of value as works of reference. A great variety of information is given in a form which makes it easy for reference and in a condensed form. The engravings are simple and intended only to illustrate the text.

"The Complete Practical Machinist," by Joshua Rose, (Bancroft & Co.) illustrated with one hundred and thirty engravings, has been before referred to. The subjects embrace lathe work, vise work, drills and drilling, taps and dies, hardening and tempering, making and the use of tools, etc. The author states as his aim the desire to develop from the promiscuous practices of the workshop its inherent science, and present it to the mechanic so arranged that he will find each formula the natural sequence of its predecessor; and while explaining its positive conditions to so present its negative ones that the mind will instinctively seek the remedy which its successor will supply. A large portion of the contents of this work originally appeared during the past two years in the *Scientific American*. The various subjects, however, are here treated more fully, while a large quantity of entirely new matter has been added. The book is one of the most valuable to mechanics that we remember. The variety of information given and the style in which it is written recommend it to the mechanic, while—as the title indicates—the practical character of the contents render it useful both in and out of the workshop. A large amount of information will be found in these pages difficult to gather elsewhere unless by practical work; and even the most skilled mechanic can profit by the experience of many, so that to him, no less than to the apprentice, Mr. Rose's work will be of value.

"Theory and Calculation of Continuous Bridges," is the title of No. 25 of Van Nostrand's Science Series. This little volume is by Mansfield Merriman, instructor in civil engineering in the Sheffield Scientific School of Yale College. It is divided into three chapters. The first presents by way of introduction some of the elementary principles of continuous girders, and the fundamental ideas relating to the calculation of strains. The second gives the theory of flexure, as applied to the continuous truss of constant cross-section, and exhibits it in formulæ, ready for application to any particular case; and the third gives an example of the computation of strains in a continuous truss of five unequal strains, with some useful hints concerning the practical building of such bridges. The work will be found of value to bridge engineers as well as to students in general. Payot, Upham & Co. have this for sale.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office at San Francisco:

ARGENTA M. Co.—Dec. 8th. Location: Nevada. Directors—G. W. Grayson, E. M. Hall, M. J. McDonald, M. Herman and John F. Cassel. Capital stock, $10,000,000.

CHAMPION M. Co.—Dec. 8th. Location: Nevada county. Directors—J. J. Rey, Henry Steinberger, George C. Hurlburt, George Fletcher and H. Vogelmann. Capital stock, $300,000.

SUMMIT COAL M. Co.—Dec. 9th. Location: Alameda county. Capital stock, $10,000,000. Trustees—S. N. Putnam, Charles Hadsell, A. J. Stevens, J. Richards and N. Hamilton.

WENONA M. & M. Co.—Dec. 9th. Capital stock, $10,000,000. Trustees—J. H. L. Tuck, H. S. Huntington, Ira G. Hoitt, W. Ayer and J. Pentscost.

F. A. SEABURY, who was in Belmont, Nye county, Nev., in 1867-9, when last heard from, will learn of something of importance by calling or addressing the PRESS office, 224 Sansome street, San Francisco, Cal. Any information concerning Mr. Seabury's whereabouts will be thankfully received.

THE BANK OF CALIFORNIA has decided to reduce the rate of interest on commercial paper to nine per cent. per annum. It is probable that the other banks will take a similar course.

THERE are a large number of men in Virginia City unable to find work. The Gold Hill *News* warns workingmen to keep away from that region.

WOODWARD'S GARDENS embraces an Aquarium, Museum, Art Gallery, Conservatories, Tropical Houses, Menagerie, Seal Ponds and Skating Rink.

General News Items.

The Spanish Cortes has passed a law making education obligatory.

The war between Egypt and Abyssinia is to be prosecuted.

Cardinal Simeoni has taken the oath of office and entered on his duties as Antonelli's successor.

Alfred Ver Mehr, the defaulting clerk of Parrott & Co., has arrived from Mexico in charge of a detective.

M. Abbadie, who had accumulated a fortune of $4,500,000 through the manufacture of paper for cigarettes, died recently in France.

E. A. McCullough has been appointed Revenue Storekeeper of the First District of California.

The New York *World* says that more than 30 vessels are ashore near Sandy Hook because of the late fearful gale.

Benefits will be given in all the theaters in this city in aid of the sufferers by the great calamity in Brooklyn.

One of the workmen engaged in excavating in Sansome street, in front of the Bank of California, for a sewer, shoveled up a man's skull on Saturday.

It is almost conceded now that the British ship *British King* will never be heard from again. She was a fast sailer and is long overdue.

The Oxford University rowing club has declined the challenge of the Yale and Cornell clubs to a four-oared race on the Thames next August.

Austria intends to appropriate 700,000 florins in order that her industries may be worthily represented at the Paris Exposition of 1878. Of this sum 200,000 is to be employed in 1877.

The attendance at the Moody meetings in Chicago is steadily on the increase, instead of falling off, as was anticipated with the severe weather. The temperance meetings especially are largely attended.

A bill introduced by Senator Merrimon provides that the Secretary of State, or in case of his death, the Secretary of the Treasury, shall succeed to the presidency in the event of the death or resignation of both president and vice president.

The block bounded by Brannan, Third, Townsend and Fourth streets, where the great fire raged in August, is being rebuilt. The carhouses and stables of the Bay View and Potrero company are being built of brick, with corrugated iron roof. These buildings, three in number, are to be as near fire-proof as possible.

The Spring Valley's water bill against the city has grown to about $230,000, because of the improvement of the public squares and the consequent increase in the amount of water consumed. Judge Dwinelle's decision in the $92,000 mandamus case will be rendered soon, and the case will doubtless be taken to the Supreme Court.

Advices from Panama are to the effect that the gentlemen whom the civil and international society appointed to survey the Paya and Caeania route for the inter-oceanic canal arrived at Aspinwall, and are making preparations to commence the survey as soon as the dry season sets in. The exploring party comprises representatives from the principal countries of Europe except Germany.

No efforts have been made this session in behalf of the Texas Pacific railroad bill, all special legislation yielding, for the present, to politics. The general feeling of the House is to adjourn at an early date until after the holidays, if the Senate will concur, or otherwise to meet and adjourn every third day, until the House investigating committee shall have returned from the South.

A Berlin dispatch says, the fact that the Russian government does not prohibit private meetings to promote the purchase of American vessels, to be used as privateers in case of war, is creating much comment among German ship-owners, who, being largely engaged in the carriage of Russian merchandise, fear the ruin of their trade if England should ever be compelled to resort to reprisals.

SCIENTIFIC PRESS—Mining and Mechanics'. PACIFIC RURAL PRESS—Agricultural.

Publishers, Patent Agents and Engravers,
No. 224 Sansome Street San Francisco, Cal.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., Mining and Scientific Press Office, S.F.

BY GUIDO KUSTEL,
Mining Engineer and Metallurgist.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose pretation is unsurpassed in his specialty.

Price $2.50 coin, or $3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy,

Containing 672 Pages and 83 Engravings

BY J. S. PHILLIPS, M. E.,

Of California, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Eight Years.

PRICE, bound in cloth, $10.50; in leather, $12. Forwarded by mail for 50c. extra, at the Mining and Scientific Press Office, by

DEWEY & CO.

Mining and Other Companies.

Cerro Bonito Quicksilver Mining Company. Location of principal place of business, San Francisco Cal. Location of works, Cerro Bonito mining district, Fresno county, Cal.

Notice is hereby given, that at a meeting of the Board of Directors held on the 11th day of November, 1876 an assessment (No. 1) of four dollars per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, 418 California street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 18th day of December 1876, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the eighth (8th) day of January, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors

J. W. CLARK, Secretary.

HARRISON'S MILLS
Grand Medal at Centennial.

Standard Flouring Mill.
Cleaner Grinder and Boiler.
Ordinary size, 9 feet by 4 feet
Capacity 5 bushels per hour.
Finest flour, largest yields.
Cooled by a strong air blast.
Runs at one-tenth the cost
Of the old style mills.
Compact, practical.
Substantial, and very durable.

Standard Grinding Mill.
For all substances wet or dry.
Built of burr stone and iron.
For heavy or light power.
10,000 in operation.
Grind 55 bushels per hour.
Thickest French burr stones.
Double discharge spouts.
Adjustable babbit boxes.
Solid self-adjusting burrs.

These Mills excel all others, even compared with those of double the size, double the weight, and double the price.

PICKERING ENGINE GOVERNOR.

Vallejo Foundry, October 17th, 1876.
MESSRS. NEYLAN & YOUNG, San Francisco,
Agents "Pickering Governors."

Gents:—The 10 two-inch Improved Speed Adjusting Governors I bought of you this year for my Patent Straw Burning Threshing Engines give splendid satisfaction. They far surpass for regularity of speed any Governor that I have ever seen, and I have seen all of the best kinds; I have seen the main belt fly off the pulley several times this season while threshing, and the engineer did not discover it, so perfectly was the speed maintained, until he was told of it; this I consider something wonderful; I consider the Governor absolutely perfect, so far as speed is concerned. I bought, and put on to one of my engines a Shive Governor, to see which was the best, and after one season's trial I have no hesitation in saying they are as far superior to the Shive, or any other Governor that I have seen or used, as the Shive Governor is to the old Butterfly Valve Governor. I wish you would send me the lowest price that you can furnish 25 Governors for next season's engines.

Yours, respectfully, I. L. HEALD.

THE O'HARRA
CHLORIDIZING FURNACE.

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing by this Process:

Two cords of wood at $6	$12.00
Two firemen at $4	8.00
1500 lbs of salt at 1½c	22.50
Wear of shoes and power	1.50
Cost for 15 tons	$44.00
Cost for one ton	2.93½

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Consolidated Co.'s mines, in the Peavine District. For further information, apply to

D. J. O'HARRA,
Reno, Nevada.

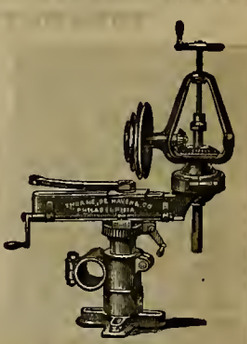
Office of Amazon and Glasgow Mining Co.,
San Francisco, Nov. 25, 1876.

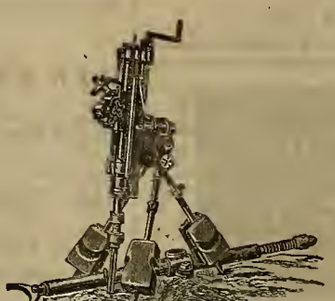
A. L. Fish & Co., Agents for Knowles' Patent Steam Pump,

Gents: After using many devices for pumping mines I must say the DOUBLE ACTING PLUNGER MINING PUMP (Knowles' Patent), bought some time since for the Amazon and Glasgow mines, is seemingly as near perfection as it is possible to be. We carry steam 500 feet to the pump, raising water 400 feet, which it does easily with 40 pounds of steam, without the slightest jar on the pipes, and is perfectly noiseless. Gravel cannot wear the cylinder, and it is by far the simplest, cheapest and most economical way I know of for draining mines. I would cheerfully recommend them. Yours truly,

A. Caldwell, Superintendent.

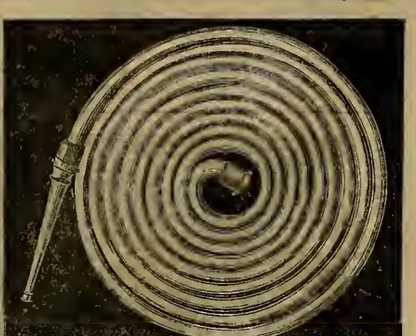


Thorne & DeHaven Drill.



Union Rock Drill.

We offer this as the least complicated and most durable Rock Drill yet introduced.



Agents for the NEW YORK BELTING AND PACKING CO.'S RUBBER TEST HOSE, expressly for Fire Engine use; manufactured by the oldest and most responsible manufactory in this country. MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, DECEMBER 23, 1876.

VOLUME XXXIII. Number 26.

Improved Hydraulic Nozzle.

Richard Hoskins, of Dutch Flat, well known in connection with his various improvements in nozzles for hydraulic mining purposes, has just received a patent through the MINING AND SCIENTIFIC PRESS Patent Agency, for an improved sectional jointed nozzle for hydraulic machines, such as are used for concentrating and directing the force of a stream of water against a gravel bank.

In the patent No. 43,468, issued to J. M. Allenwood, July 12th, 1864, and reissued, a discharge-pipe and nozzle is represented as being made in two parts which are connected by a canvas or other flexible joint so that the extreme end of the nozzle can be moved in any desired direction. By moving this hinged extremity in either direction so as to cramp it upon the stream of water which was passing through the nozzle, it acted as a rudder to carry the pipe in an opposite direction.

Patent No. 177,419, which was issued to H. C. Perkins May 16th, 1876, shows a supplemental attachment in the shape of a short tube or deflector—as he styles it—placed at a short distance in front of the nozzle and only attached to the nozzle by a universal joint at one place, leaving an open space between the end of the nozzle and the rear end of the short tube or deflector, thus permitting the water to fly back through the opening and drench the operator when the stream is cramped by the deflector. This deflector is also described as being larger in dismeter than the extreme end of the nozzle.

Mr. Hoskins' improvement consists in making the nozzle itself a deflector by attaching it to the end of the discharge pipe by means of a ball and socket or other water-tight joint, so that it will not only serve as a nozzle for the main pipe to carry and direct the stream, but will serve as a rudder to change the direction of the discharge pipe by cramping it upon the stream. The end of the discharge pipe is provided with an enlarged semi-globular head, and over the head is fitted a socket. The socket is attached to the head by a pivot or journal both above and below, so that it can swing from side to side. The front end of the socket has a short circular neck or flange formed around the opening and projecting out in front of it, through which the water issues, and the flange is tapped with screw threads. The nozzle is then screwed upon this threaded flange, thus completing the attachment of the nozzle. At the end of the discharge pipe is the lever by means of which the deflector or nozzle is operated.

When this lever is moved to the right or left the nozzle will point in an opposite direction, forming an angle between the pipe and nozzle, against which the water, passing through with great force, will act and cause the discharge pipe to turn and point in the direction in which the lever is directed. The discharge pipe being always balanced with a counterpoise there is no difficulty in elevating or depressing it; the difficulty is only in moving the pipe horozontally or from side to side. Hence the joint has only two pivots, but it desired it can be made to operate vertically by making the pivot holes oval, so as to allow the joint to vibrate vertically when the lever is moved up or down, thus forming a sufficient angle in the pipe to allow the water to act in the nozzle and move it in this direction also.

By this means Mr. Hoskins provides a discharge pipe with a hinged nozzle so that the nozzle itself will serve as a deflector to move the pipe by cramping it upon the stream, and when the pipe is stationary it will serve as an ordinary nozzle to condense and deliver the stream.

BERTHS for shipping are now plentiful at the wharves.

Academy of Sciences.

The regular meeting of the California Academy of Sciences was held on Monday evening last.

Dr. A. Kellogg described species of flora of the Gulf of California, collected by Mr. W. J. Fisher, in the "*Harvest Queen*" expedition, now in the Gulf.

Mr Henry Edwards' paper on Pacific Coast *Lepidoptera*, No. 21, was presented. This series is being continued, and is published in the proceedings of the society.

Hon. Horace Davis, Chairman of the committee of nominations presented the following report: The committee appointed to present a ticket of officers to the Academy of Sciences, to be voted for at the coming election, beg to offer the following report: They have esrefully considered the responsible duty assigned to their charge, and have nnanimously resolved to recommend to the academy the re-election of the present officers and trustees.

They were lead to this conclusion by a consideration of the unsettled condition of the temporalities of the academy. Many matters of grave importance, and at the same time affairs of a complicated and delicate nature, have often been under discussion at the joint meetings of the council and the board of trustees, and it seems to them only ordinary prudence to continue these gentlemen in their duties for the present. They, therefore, recommend the following ticket: For President, George Davidson; for Vice President, Henry Edwards; for second Vice President, Henry O. Hyde; Corresponding Secretary, Dr. A. B. Stout; Recording Secretary, Charles G. Yale; Treasurer, Edward F. Hall, Jr.; Librarian, C. Troyer; Director of Museum, W. G. W. Harford. Trustees—D. D. Colton, R. E. C. Stearns, Wm. Ashburner, Thomas P. Madden, Geo. E. Gray, Ralph G. Harrison, John G. Miller.

Mr. Davis offered some remarks upon the report, which, without discussion, was unanimously adopted.

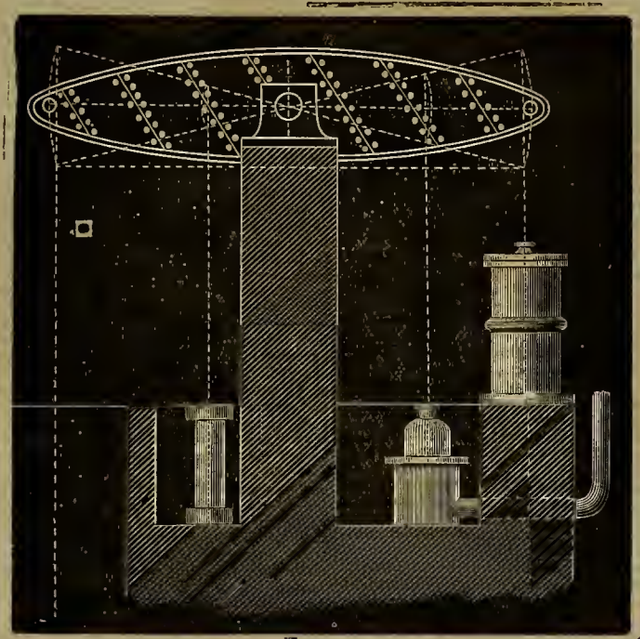

FIG. 15. CORNISH ENGINE.

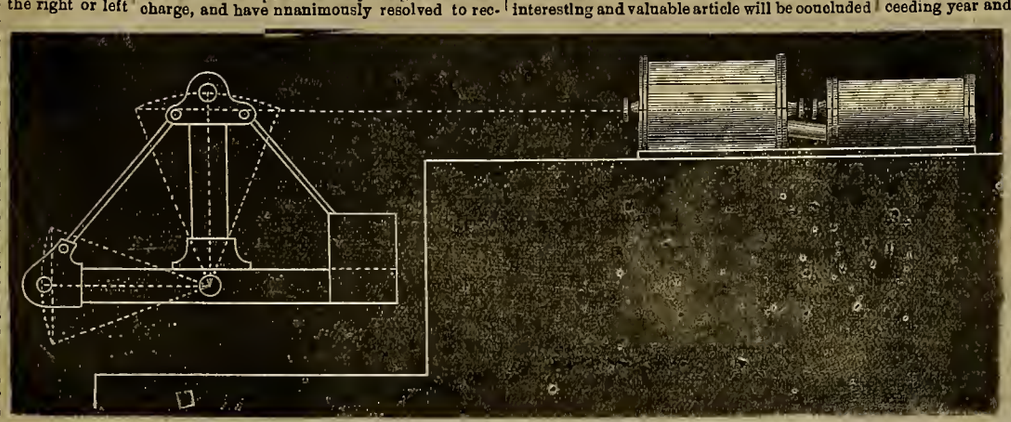

FIG. 19. HORIZONTAL COMPOUND ENGINE. Proportion, 7 to 8.

LAID OVER.—Owing to the crowded state of our columns incident to the publication of the engravings in connection with the article on "Drainage of the Comstock," considerable matter has had to be laid over this week. This interesting and valuable article will be concluded next week, the interest felt in the subject being an excuse for devoting so much space to it to the exclusion of the usual variety of matter.

A TERRIBLE colliery explosion occurred on the 18th, in the South Wales company's pit, near Newport. Seventeen bodies have been recovered, and many of the miners taken out alive are seriously, and some fatally injured.

Christmas.

The queen of holidays is just at hand. The day which all Christendom greets with rejoicing, which brings to all, both young and old, joys which are as old as memory and yet as new as each succeeding year, will soon fill our homes with the joyful cries of happy children and the quiet rejoicing of those who love them.

Christmas is the childrens' day, and thus it has been during all these centuries since the star shone on Bethlehem, and hailed the advent of the Christ-child. What matters it though the doubter try to prove the day we observe is not indeed the exact day of the Saviour's birth? It is the event and not the day which calls for the world's rejoicing. What matters it though labored treatises be written to show that the star which shone on Bethlehem was only the periodic visit of a comet instead of a star called fresh from God's workshop to mark the time? It matters little. No modern theorizing can shake the deep significance of the events. No acute argument can wrest from the believer the consolation of his faith. No ingenious reasoning can rob the world of the sublime influence of the simple story which happy mothers tell to listening children; how a little child, such indeed as they, came into the world, sent from God the father, to teach little children, by his loving precept and example, how they should live and act to gain the crown at last.

No; Christmas is too firmly woven into the fabric of the world's thought and faith to yield to arguments of date or incident. It is a day for the world's good. Let it be the occasion for the rejoicing and thanksgiving of the devout, let it be for the rest and recreation of the tired toiler, or let it be the brightest day in all youth's bright calendar; in all of these, its characteristics, it is a day which the world in losing would be poor indeed.

Time honors Christmas. The observation of the day by religious ceremonies dates back nearly 1,700 years, and ever since, the holiday has held its place in the pomp of Roman ceremonial and in the quiet of Protestant worship. Other marks of the day have been recorded as the years have advanced. From the gay, fantastic spectacles and dramas of the middle ages, it progressed to the gentler care of the minstrels from the mountains, and later still, its music went forth upon the chimes of bells. As the centuries passed new customs marked the Christmas festival. The Germans gave it the charms which fill the hearts of children, and called Santa Claus to its service. Then it was that the Christmas tree took root and spread its branches laden with the fruit of love. Ever since the growth has advanced with each succeeding year and with the spread of Christianity over the world, until now the Christmas moon in all her round may shine on happy homes where youth's delights are full.

Beautiful indeed is the coming of Christmas upon the sanctuary and the home. Bright are the decorations of nature's living green. Honored are the holly, ivy, rosemary, bay, laurel, and mistletoe, which have become historic across the waters; and fragrant are the pine, hemlock, fir and cypress, which turn our homes into bowers of beauty.

Though some of our friends in the mining regions are very far from the home of their childhood, and Christmas at home is only a recollection with them, the season which brings it should turn their thoughts to the old roof tree and those whom it sheltered. The rough, hard lives which many miners live in their toil for gold, is apt to cause them to be careless of the holidays, except that they bring them temporary rest from labor. The Christmas holidays should be welcome to all and should be a time for merry-making and pleasure for both old and young. In the hope that they will prove so to all our readers, we close our remarks by wishing them all a merry Christmas and a happy New Year.

CORRESPONDENCE.

The Lixiviation Process.

Mr. Smith's Answer to Mr. Hoffmann's Article.

EDITORS PRESS:—My attention has been called to a communication in your issue of October 28th, written by Mr. O. Hoffmann, calling in question the truth of certain statements made by myself in a letter to the San Francisco *Bulletin* in August last.

Mr. H. invites a reply, which with your permission I propose to make. I will first answer his enquiry, why, when I found I could not extract the silver by amalgamation or smelting, I did not, with the aid of my "amateur chemist" introduce the "Patera" or "Kiss" process? Simply because I had never heard of it; and the reason I went to the expense of employing Mr. Hoffmann was, first, to introduce his, viz: the Kustel & Hoffman patent process, and next, because he was a young man highly recommended, fresh from schools of Freiberg, and in those days of our ignorance and credulity, we thought that a graduate of Freiberg was the concentration of all scientific and metallurgical knowledge. We know better now.

As stated in my letter to the *Bulletin*, I went to San Francisco expressly to see the Kustel & Hoffmann process, taking some of my ores with me and had them tested at Messrs. K. & H.'s works in San Francisco. The result was so satisfactory that I determined to adopt the process at my hacienda, and employed Mr. H. to superintend the introduction, and the apparatus taken from San Francisco was gotten up under his direction, even to the wooden gas generator, Mr. Kustel giving it as his opinion that such a generator coated with asphaltum cement would answer the same purpose as one made of lead.

In all this there was no mention made of any other mode of treatment of my ores than by the Kustel & Hoffmann process, and the use of the "cold chlorination" was, so far as I was informed, the essential feature of the process and the only process introduced or used at my works until after Mr. Hoffmann left and went to La Trinidad, and he did not at any time work any ore at my place without the use of "cold chlorine gas."

Of this I could furnish proof in abundance if the point was a matter worth the trouble. His statement that they advised me that the cold chlorine gas was not necessary for my ores, but that I insisted on having the "whole process, so as to demonstrate it to other parties for the sake of my interest in the to-be-granted patent," is simply untrue, as was the statement that they were induced to apply for letters patent from the government of Mexico.

They stated to me that they intended to apply for letters patent from Mexico, but it was finally proposed that in consideration of my introducing the process into that country, that I should obtain the patent in the name of Kustel & Hoffmann and myself, paying all the expenses myself and owning one-third interest in said patent, my own hacienda being exempt from the payment of royalty. This proposition was agreed to and I made application for the patent through Mr. Godey, Mexican Consul at San Francisco.

Mr. H. is equally incorrect when he states that he designed the three-hearth reverberatory furnace.

As stated, the flood had destroyed our Bruckner furnaces, and also a reverberatory furnace, (which Mr. H. says neither myself or my "amateur chemist" were familiar with,) and it became necessary to build a new furnace. After examining several designs found in some metallurgical work, I decided on a three-hearth furnace, and Mr. Hoffmann being an excellent draftsman, fresh from Freiberg, was employed to make the working plan, and the work was well done and an exact copy of the design found in the book. After the furnace was built it was found that the arch was too low over the last or chloridizing floor. It worked well while we were doing only a partial roasting preparatory to "cold chlorination," but when we desired heat enough to desulphurize or oxidize the ore on the first and second hearths, the ore was being burned and fused, and formed into balls on the hearth nearest the fire. The arch was consequently raised from 16 to 28 inches at the bridge. By a typographical error in the *Bulletin* article before referred to, I was made to say "we commenced to improve our mechanical appliances, altering our doors so as to effect great economy of fuel, etc." which should have read "altering our ovens so as to effect greater economy of fuel and more thorough chlorinization of the ore." The cast iron frames Mr. H speaks of were put in when the furnace was built and are there still.

Mr. H. is equally in error in regard to the substitution of sulphide of calcium in place of the sulphide of sodium; as stated in my article in the *Bulletin*, the extreme difficulty of the manufacture of the sulphide of sodium, or its importation from San Francisco, owing to its liability to spontaneous combustion, suggested to Mr. T. C. Mills, who had for a long time been in charge of my beneficiating works, (whom Mr. Hoffmann sneeringly speaks of as our "bricklayer,") the idea of the use of the sulphides of calcium or potassium, and Mr. H. was asked if they would not answer as well, to which he replied that he supposed they would. The formula for making these sulphides was found in some medical work, I think the U. S. Dispensatory, and Mr. Hoffmann proceeded to experiment with calcium and Mr. Mills with potassium, which resulted in the adoption of the sulphide of calcium, as it was the most easily made and the materials more easily obtained.

I do not recollect whether the idea of obtaining hyposulphite of lime by precipitating base metals dissolved by water, originated by the powerful use of Mr. Hoffman's reasoning faculties, as he claims. My impression is that it did not; I only know that one of his statements relative to the loss of our hyposulphite solution is incorrect, viz: that it was occasioned by the mistake of Mr. Mills, as it was another employee entirely; and I know the further fact that shortly after Mr. H. left La Trinidad the superintendent in charge sent to me for some hyposulphite of soda or for information how he could strengthen the dissolving solution, which had become weakened by a similar accident that befel us.

Mr. H. errs again when he says he left La Dura to obey a call from Mr. Alsua of La Trinidad. Mr. H. left La Dura because our gas generator gave out, and it was expected we would have to suspend operations until I could send to San Francisco and get a lead generator, as recommended by Mr. H. That he might not be out of employment in the meantime, I furnished him with a horse and guide and a letter of introduction and recommendation, and sent him to Mr. Alsua at La Trinidad, and upon that recommendation he was employed and introduced his "Kustel & Hoffman process," and all the necessary apparatus and materials were ordered from San Francisco; but before they all arrived Mr. H and Mr. Alsua had a disagreement and Mr. H. left. Mr. Alsua has always claimed that he was out several thousand in his experiments in that process. Those who know Mr. Alsua will not question his statement.

I believe I have answered all the points at issue between Mr. Hoffman and myself. I am aware that it is mainly a question of veracity, and in that matter I am willing the public should judge between us. If it was a matter of much importance I could bring abundant proof to substantiate what I have stated, but as I have no patent to defend or anything to sell, it is not worth the trouble. I do not claim any originality in the invention of the process, I only claim that I made the experiments which resulted in a process now in universal use in Sonora and in many parts of Sinaloa and Lower California, without any previous knowledge of the process of Kiss and Patera, and against the advice and emphatic protest of Mr. Hoffman, as I can show from his letter to me, written from Trinidad.

All that the public are interested to know is that the process is a success; that it has been in constant operation for more than seven years since it was first introduced and that all processes of amalgamation in that country have been abandoned, and this process adopted in their place, and that no one who has tried it has even thought of using any other in its stead.

I am now engaged in introducing this mode of treatment in the works of the Consolidated Poe mining company, in the Peavine district, Washoe county, Nevada. These ores are known as exceedingly rebellious and have baffled the skill of some of the best experts on the coast. I have found no difficulty in working these ores and the results have been highly satisfactory to the owners of the mine. E. B. SMITH.

Poeville, Nev., Dec. 11th, 1876.

Miners' Wages.

In answer to the following communication, says the Virginia *Enterprise*, we would say that all miners who descend into the mines receive $4 per day, but the day is not always fixed at eight hours. Some of the outside mines run but one shift and fix the day's work at 10 hours. Some run two 10-hour shifts. But whether six, eight or 10-hour shifts are worked, the wages, as regulated by the miners, are not less than $4 per day. As to car-men, they do not fall within the protection of the unions, and the length of the day and compensation is fixed per agreement with the company. Generally shifts and wages correspond with those of the miners. Watchmen are generally on duty 12 hours, but not always. Their wages, like those of carpenters, etc., are fixed by agreement. The rule is established only as to wages of miners underground, which are not less than $4 per day.

Editor Enterprise—Sir: Will you please state, through the columns of your paper, the regular or standard wages paid to men directly connected with mining on the Comatock, as your correspondent contended last evening that all men working in or connected with the mines received $4 per day for eight hours' work, including car-men, some of whom have to work 12 hours a day; also watchmen, who have to be on duty from 12 to 13 hours, receive $4 per day. I admit there are some who handle wood and only work 10 hours, and day-shift all the time, who receive $3.50 per day, which is the lowest wages paid to my knowledge. You will please explain and oblige yours, etc.,

GOLD HILL.

The St. Lawrence Mine.

The editor of the *Mountain Democrat* has been inspecting the St. Lawrence mine, El Dorado county. He says:

Arrived at the mine, Superintendent Harry Rosswarn took charge of our party and spared no pains in making our visit pleasant and instructive. Everything in the vicinity of the St. Lawrence wears an air of bustle, activity and improvement. A neat building has been erected near the hoisting works, designed for an office, superintendent's bed room and a dressing-room. A large stock—700 cords—of wood has been hauled in and stacked in the vicinity of the mill. There is a sawmill under the same roof with the hoisting works, in which the company saw all their own timbers, lagging and lumber. The yard is well stocked with saw-logs. In the quartz mill active improvements are in progress. The concentrators and plates are in course of re-adjustment, the large rock-breaker is being re-set, a full complement of new stamps is at hand, the large engine is being overhauled and the whole concern is being put in perfect order for the effective operation of 20 stamps by the time that a sufficient supply of ore has been extracted.

After a hasty inspection of these surface improvements, five of us mounted a truck and made the descent to the 850-foot level, occasionally, as we caught our breath during the quick downward movement, seizing one and another opportunity for admiring the neat, substantial, nicely mechanical and yet massive manner in which the grand shaft has been retimbered. The size of the timbers and the workmanlike manner in which they have been adjusted convey to the underground explorer a most comforting sense of absolute security.

At the 200 foot level, on the way down, we caught a glimpse of a number of delvers at work, who are engaged in drifting and stoping a body of low grade ore until the lower levels are put in shape for their employment on the richer bonanza rock. Of this low grade ore, which will mill from $12 to $15 per ton, about 250 tons have been taken out and deposited on the dump, and it is calculated that from 400 to 600 tons more will be extracted from this source by the middle of January, when it is supposed the lower level will be in shape to accommodate the whole force.

Arrived at the 800-foot level we beheld a sight such as has seldom, if ever, greeted our bewildered and delighted gaze. It would be difficult to imagine a handsomer ledge than is here revealed to view. From the point where the bonanza was first tapped, above and just west of the tunnel, to the bottom of the drift, below and east of the tunnel, a distance of over 40 feet, a beautifully ribboned, fine, strong ledge, varying from 20 inches to three feet in width, everywhere seamed and flecked with free gold and rich sulphurets, is plainly exposed to view and presents a most exhilarating aspect. Our party mined out and brought to the surface several slabs of ore, from a foot to 18 inches long, eight to ten inches wide and four to six inches thick, which, on being washed and inspected in the sunlight, revealed a dazzling display of the precious metal. It is estimated by experienced and cautious miners that the ore thus far taken from and exposed at this level will average fully $100 per ton. We are confident that this is by no means an exaggerated estimate. Ore from this level and of this quality to the amount of 150 tons or more has been already extracted and dumped into the ore-house. But the superintendent and managing directors of this mine don't intend to butcher it for the purpose of creating a furore. All of their operations are of the thoroughly systematic and permanent order. They will sink on their pay shute to a depth of 100 feet. Then they will sink the main shaft to an equal depth, with every assurance that in this main shaft they will intersect the ledge after sinking but a few feet. At the 900-foot level they will follow the ledge and connect these two shafts, at the same time drifting northward from the northern shaft. Then look out for such clean ups as have never been realized from an El Dorado county quartz mine! On this point we have no doubts or misgivings whatever. The smoothness of the foot-wall, the uniformity and definiteness of the gouge, the lively character of the country rock, all give assurance of the permanency and reliability of this ledge. And the company is to be congratulated on the volume of pure air which has been secured by sinking the new air-shaft, at the bottom of which the draft was so strong as nearly to extinguish our candles. In every respect the mine and its surroundings are rapidly assuming a shape for vigorous and successful operations.

A MINERS' SUGGESTION.—A miner of Gold Hill, in a communication to the *News*, in reference to injuries from the sudden lowering of cages upon men working in the shaft, says: "Such an accident need never occur in a shaft which is being sunk by means of cages. Place a bell on the fifth set of timbers from the bottom of the shaft, and move it downward as the shaft progresses deeper and additional sets of timbers are put in. Have it so arranged that the cage shall ring it in passing, whether going down or coming up. This will give good warning and allow the men in the shaft an opportunity to look out for themselves." The suggestion is doubtless a good one, provided the bell can be so placed and fixed as to be sure of giving the alarm, and not liable to get out of order; for, in the latter case, the remedy would be worse than the present method of stopping the cage before lowering clear to the bottom.—*Virginia Enterprise.*

The Richmond Company.

We extract from the London *Mining Journal*, of November 18th, the subjoined, with reference to the Richmond mining company:

Richmond Consolidated, 9 to 9¼, ex. div. The usual weekly telegram gives the week's run as $55,000. It appears that the manager's report has again been delayed in transmission for about the sixth time in the last six months. The directors have issued their statement of accounts for the year ending August 31st, with a report. An additional document is sent to the shareholders on this occasion in the shape of condensed abstracts of all previous accounts, showing at a glance the receipts on capital account, and how the money has been expended, the profits made from year to year, and how distributed or appropriated. It is shown in this abstract that the mine has made a net profit of £272,297, of which £180,768 8s. has been paid in dividends, £78,170 13s. 8d. used on capital account, and the balance carried forward. The mine is thus proved to have earned £2,297 16s. 2d. more than its whole capital up to August 31st; and as the profits for September and October are estimated at £20,000, the net earnings at present amount to £22 297 16s. 2d. over the capital of £270,000. As the accounts prove that the advances made by the bullion agent are much more than covered by bullion in his hands, the company is virtually clear of debt; and the last paragraph in the "report," thus sums up the present position of the company: "In conclusion, the directors congratulate the shareholders on the fact that the accounts now submitted show, that whilst the debentures are fully represented by bullion and other revenue assets, there are undivided profits on hand amounting to about £28,000 over and above the largely increased value of the mining properties, the machinery, steam-engines, plant, refinery, furnaces and other buildings, together with the valuable reserves of ore already developed, and which are increasing daily beyond the present smelting power of the company." The result of the whole year is disappointing as to immediate results, referable no doubt to the great difficulties and disappointments connected with the having for the last six months to deal with the immense mass of ferruginous ore that unexpectedly presented itself, and had to be used before the more richly leaded ores at its back could be obtained. The profits made since this difficulty has been overcome, and the vast mass of good smelting ores now laid open, point to a return of former rates of profit, to which the recent rise in silver will materially contribute.

The Baker Gravel Claim.

The Dutch Flat *Forum* (Placer county) says of the Baker claim: Next to the commencement of the Yankee tunnel, the opening of this claim is one of the most important eras in the history of Dutch Flat. To the former can be traced the nucleus which gave the impetus to the various large enterprises with which we are now surrounded, and the latter is opening the envelope containing our future destiny. This claim is now being opened through a perpendicular shaft, dumping into Yankee tunnel. Above this point, on the ancient channel, there is neither the immense rock and clay slide or drifted ground to contend with, which impairs the claims situated at the lower end of the ridge, and as the claims below have been fabulously rich, and the gravel that has been drifted out of this claim sustains the same reputation, it is believed that the Cedar Creek company is just reaching a treasure which cannot be exhausted in 40 years to come. There intervenes between the point of attack and the shaft quite an area of tunnel ground, which must be removed before the solid ground can be reached. This work is being done in a systematic and effective manner. An incline was raised along the surface of the bedrock, extending from the shaft to where the rim was exposed. The giants are placed so as to command the opening thereto. The gravel is being blasted and broken down from the face toward the shaft, and as the material is removed the bedrock is being swept clean, so that by the time the face over the incline is extended back to the shaft, the north end of the pit will have reached the solid banks, and the claim will be in a splendid condition for working, with a clear space of bedrock in the rear sufficient to hold the boulders raised out by the derrick. From some old drift tunnels below six powder drifts are being run, so as to be in readiness when wanted, and everything that foresight and precaution can suggest is being forced to contribute toward continuous washing.

BALD MOUNTAIN MINE.—This mine is situated at Forest City, Sierra county. It is perhaps the richest gravel mine in the State. The mine is worked by drifting, and the drift is taken from the breast to the place of washing in cars through the tunnel. These cars run on a track of 20 inches gauge, laid with T rail, and are drawn by a steam locomotive. The tunnel is between 3,000 and 4,000 feet long and the grade in it is from 160 feet to 216 feet to the mile. The average yield of the mine per year is about $400,000, of which about $18,000 are paid over in dividends. Just now there is a scarcity of water at Bald mountain, but soon there will be plenty. The mine and works are under the superintendence of Mr. H. W. Wallace.

MECHANICAL PROGRESS.

How to Sharpen a Screw-Driver.

The screw-drfver, says the *Builder*, is fonnd not only in the tool-chest of every mechanic, but in most honses and offices. It ranks with tha hammer, the saw and the exe in generel utility, end yet few persons know anything abont how it shonld be sharpened so as to do its work most effie ently—that is, with the least expenditure of power, and the least lnjury to the heads of the screws.

In driving a screw ioto wood, the force nsed to press tbe acrew-driver against the head of a screw, tends to aid the letter in penetrating the wood, bnt when we attempt to extract a screw, every pound of pressure that we apply tends to render it more difficult to get the screw out. It therefore becomes very important that tha screw-driver shonld be so formed that it may be kept in the nick of the screw by the exertion of the very least degree of force, for if it has any te deocy to slip out we can keep it in place only by applyiog pressure, in which case we rnn great risk of injnring the nick and rendering it impossible to draw the screw.

If we examine a screw driver in the condition in which it is so ordinarily found, we shall fiod tbat it presents a section in which the sides of the wedge, in which all screw-drivers terminate, are curves with the convex sides outwards. Now, the effect of thns curving the sides of thie wedge is to render it greatly more obtose. Moreover, when we turn the screw-driver, the tendency to slip out of the nick is just in proportion to the obtuseness or bluntness of the wedge, and therefore this form is the very worst that can be chosen. In the hands of good workmen, therefore, we find that the screw-driver ends in a wedge of which the sides are perfectly straight. Tbis is a very good form, bnt it is not equal to that in which the aides of the wedge are curves, bnt the concave sides outwards. In this way we lessen the obtuseness of the wedge at the extreme point aod produce a turn-screw which may be kept in the nick by the least possible pressure endwise.

To grind a screw-driver iuto this form, it is necessary to use a very small grindstone, aod many of the artificial stooes loiind io market answer admirably. Many mechsnics wonld find it to their advantage to keep one of these small griudstones for the porpose, as it conld be run in the lathe with very little trouble.

Impaovement in Telegaaphy.—An English engineer has inventad a new telegraph joint, which, it is claimed, presents a simple, cheap and efficient means of dealing with one of the practical difficulties of subterranean telegraphy —one, in fact, that seems almost insuperable. This new joint is formed by removing the coatings from the two ends to be nnited and joining the cleaned wires hy what is technically known as the "bell-banger's twist," no solder being necessary. The twist is then warmed slightly and covered with a rongh coating of insulating compounds, somewhat thicker than the original diameter of the wire. The joint, while warm, is placed in the lower half of a small wooden block abont three inches long, one inch wide, fitted internally with a groove for the wire, widening in the middle into a niche abont one and one-half inches in length for the reception of the compound covered joint. While the compound is yet warm the upper half of the mold—in shape corresponding exactly with the lower one—is placed on the top, and, by means of a clamp, screwed down until the two wooden surfaces are pressed firmly together. While in this position they are permanently fixed by half a dozen ordinary brass screws, and the compound having hardened the clamp is removed and the joint complete. The cavity in the interior of the block in which the copper ends meet being completely filled with the compound, the insulation is all that could be desired, numerous experimenta having satisfactorily tested the electrical qualities of the arrangement, the wooden covering obviating all danger of "leakage" or separation of the wires through bending.

Casting a Statue.—The lower half of Conrad's statue of a soldier, to be erected in Hartford, Conn., has been cast in bronze in a foundry in New York. The upper half had been finished. The figure is heroic in size and represents a young Union infantry soldier in uniform, including overcoat, and carrying a musket. A large "flask," containing the mold, clamped firmly with iron, was let down with a crane into a cavity and floored over so that only a funnel protruded; this was close to a great brick furnace, in which the bronze was heating over a great roaring fire. Some of the brooze slopped over and set fire to the foundry building, and the water that quenched the blaze made so much steam that nothing else could be seen for five minutes. The casting was perfect. Several Hartford officials were present and witnessed the casting.

Iron Steamships.—The enterprising undertaking of Mr. John Roach, of Chester, of building two new iron steamships in advance of orders is one of the hopeful signs of the times. It shows that there are fair business reasons for believing that the importance of energetic efforts to reassert national supremacy in the matter of ocean tonnage will soon command general recognition.

The Dish on Wagon Wheels.

A writer in the *Hub* gives the following points for blacksmiths: Many smiths put on their tires too loose, being afraid of getting too much dish, and are satisfied if only the boss and customers are pleased when they look at the wheel. But they do not look to see the broad daylight all around the wheel between rim and tire. How can such a wheel answer the purpose, when the tire does not hug the rim? Allowing mud and water to settle between them, is sure to spoil rim and tenon of spoke, or crowd the tire off. The wheel, after a few months, comes back to the shop for resetting; the smith sees his mistake, and in most cases the tire then gets put on too tight. Let a wheel be thoroughly seasoned, have the proper thickness of tire, and snug fitting on the rim; never mind the dish, a little more or less, if only the spokes do not spring; and you find in the end a more creditable job than having the tire too loose, but less dish.

Such wheels will sometimes run years without setting tire, or will wear it out, if properly taken care of in the dry season. What I mean by care, is to have the rims painted when bare spots begin to show, and to be often washed.

The talk about so much dish for a certain size of wheel, and no more, is all bosh. I have handled wheels, and so have many others, I suppose, where one set dished much more than the other, with the same amount of draft on both. It is impossible to establish a rule for dish on wheels, but have the tire so set on the wheel as to become what it should be, a protector.

Experiments in Lubrication Desired.

A committee of the master mechanics' association is resolved to elicit the best experience of locomotive engineers upon the subject of lubrication, and they issue a circular asking all mechanics to aid them with information on the following points:

The most desirable lubricant for general use must, of course, be that always obtainable, as well as the cheapest, or that which will give the best results at the lowest rate, and something easily carried and handled at all seasons of the year, unless you should consider a change of lubricants at different seasons of the year advisable.

Your committee therefore earnestly request you, and they certainly think it worth your while, to make a careful test of sufficient length of time to demonstrate the actual cost per mile, or per 100 miles run, with the different varieties of oil in use, taking perhaps No. 1 lava oil as the starting point. Will every member take the trouble to do this carefully and thoroughly, and give us a statement, showing in detail the exact result?

Your committee further solicit the results shown by oil-testing devices, and a description and drawing of the best apparatus for such purposes you have used.

Your committee also desire you to test, if possible, the different kinds of lubricants used for valve seats and cylinders, and give results, with your preference, and reason thereof.

Also what method is the best for oiling valves, the self-feeders, or the old plan of oiling from a can at intervals.

A Snow Melting Machine.—A snow melting machine for cities has been invented by Mr. John Mullaly, one of the New York commissioners of assessments, and Mr. John T. Hawkins, formerly professor of engineering at the naval school of Annapolis, and late one of the superintendents of the Centennial exhibition. The last patent was obtained about two weeks ago, and the inventors claim that the machine has been brought to a state of perfection that leaves nothing more to be desired. By their process one snow melter is capable of cleaning off from one to 50 miles of streets in 24 hours, the amount of work performed depending upon the size and capacity of the machine. The steam which is employed in melting the snow and ice is not only superheated but by an admirable and at the same time simple contrivance it is all used in creating a draft in the furnace. By this means the consumption of fuel and consequent production of heat are greatly increased. In addition to the important result thus obtained, the heated gases of the furnace are also used in the work of dissolving the snow. The inventors, who have made a proposition to the street cleaning department of New York, estimate the cost of removing the snow by their process at from one-fifth to one-tenth the expense of the present inefficient and unsatisfactory system of carting it away. They claim that one of their smaller sized machines is capable of doing as much work as 400 carts with the requisite number of men and horses.

Danger of Portable Steam Boilers.—*Iron* says: The chief engineer of the Manchester steam users' association, Mr. L. E. Fletcher, who has done yeoman service to the public by his unceasing efforts to reduce the number of deadly accidents from imperfect steam boilers, at the last meeting of the association brought forward the subject of portable boilers and their special dangers. Portable boilers are often placed under the charge of agricultural laborers and other persons who are below the average in mechanical skill; and it is important to know that in addition to this source of peril there is a great neglect prevalent among their constructors with respect to their proper fitting with safety valves. It is obviously essential that in ignorant hands the safety valve should be placed beyond the danger of being tampered with; but these valves are, Mr. Fletcher tells us, so arranged that an extra turn of the thumb screw on the spindle of the screw balance with which it is loaded, frequently suffices to lock the valve fast and render it perfectly useless, thus bottling up the pressure and leading to the bursting of the boiler. Many cases of fatal accident from the bursting of portable boilers are on record. By seven which were quoted twenty persons were killed; in one of them eight persons perished. Mr. Fletcher's conclusion is one in which most sufficiently informed and competent judges will agree—namely, that the safety of the public from the risk of boiler explosions can only be secured by legislative enactment.

The longest railway in South America is the Tucumun, in the Argentine Republic, recently completed. It is 366 miles long, and has cost only $23,800 per mile, which is much less than the cost of any other railway in that republic, and indeed is cheap for any country, as the cost of railway building has been.

SCIENTIFIC PROGRESS.

The Great Pyramid.

Prof. Smith, says *Nature*, devoted many months of work with the best instruments in order to fix the dimensions and angles of all accessible parts of the great pyramid of Egypt; and he has carefully determined these by a comparison of his own and all previous measures, the best of which agree pretty closely with each other. The results arrived at are as follows:

1. That the pyramid is truly square, the sides being equal and the ranges right angles.

2. That the four sockets on which the four first stones of the corners rest are truly on the same level.

3. That the directions of the sides are accurately to the cardinal points.

4. That the vertical height of the pyramid bears the same proportion to its circumference as the base as the radius of a circle does to its circumference.

Now all these measures, angles, and levels are accurate, not as an ordinary surveyor or builder could make them, but to such a degree as requires the very best modern instruments and all the refinements of geometrical science to discover any error at all. In addition to this we have the wonderful perfection of the workmanship in the interior of the pyramid, the passages and the chambers being lined with huge blocks of stone fitted with the utmost accuracy, while every part of the building exhibits the highest structural science.

In all these respects this largest pyramid surpasses every other in Egypt. Yet it is universally admitted to be the oldest, and also the most ancient historical building in the world.

Albertite.—A very curious mineral, known as albertite, is found in New Brunswick. The *Iron Age* says: It occurs in connection with calcareo-bituminous shales, and has been by some regarded as true coal, by others as a variety of jet, and by others again as more nearly related to asphaltum. The true nature of the mineral was made the basis of a lawsuit in Scotland a few years ago, in which the amount involved was something more than £1,000,000 sterling; as the decision settled the question of the liability to pay a royalty. It resembles asphaltum very closely, being very black, brittle and lustrous, and like asphaltum, is destitute of structure, but differs from it in fusibility and in its relation to various solvents. It differs from true coal in being of one quality throughout, in containing no traces of vegetable tissues, and in its mode of occurrence as a vein and not as a bed. The vein occupies an irregular and nearly vertical fissure, and varies from one inch to 17 feet in thickness. It has been mined to the depth of 1,162 feet. The accompanying shales are abundantly filled with remains of fossil fishes, and it is not improbable that from these, in part at least, the mineral was derived, existing at first in a fluid or semi-fluid state. Vegetable remains are almost entirely wanting in the shales. During twelve years since the discovery, there have been shipped 154,800 tons of albertite, chiefly to the United States, where it has been used for the manufacture of oil, and for admixture with bituminous coal in the manufacture of illuminating gas. It is admirably adapted for either of these purposes, yielding 100 gallons of crude oil, or 14,500 cubic feet of gas of superior illuminating power per ton. The price varies from $15 to $30, gold, per ton.

The Satellite of Neptune.—Since the erection of the great refractor at Washington, observations have been made of Neptune's satellite, with the view of determining the mass of the planet in terms of the sun's mass, which can be done with great accuracy by comparing the time of revolution and the distance of the satellite from its primary, with the corresponding quantities in the case of a planet revolving around the sun. Prof. Holden discusses, in the *Astronomische Nachrichten*, the results thus obtained, finding the mass of Neptune to be 1 18,500th part of that of the sun, or nearly double that of the earth, a value which is somewhat smaller than that found by Prof. Newcomb from his observations in 1873 and 1874, and much nearer the mean of the results obtained by previous observers.

Insecticides.—The *Chemist* gives the following abstract of a paper by Mr. Massie, in the *Repertoire de Pharmacie*: "For three years the author has made use of bers of forged iron, weighing about one and a half kilograms, for the preservetion of barley, rice, bran, wheat, etc., in whitewood boxes, holding 150 liters. Though it is difficult to explain the action of the metal, it is none the less an excellent preservative. Metallic mercury produces similar results, and in certain cases is more efficacious than iron. That he might be in possession of certain data on the efficacy of two metals, the author experimented by placing in glass vessels, holding one liter, the following substances—viz: barley, rice, bran, meel, ergot of rye, cantharides, and white biscuit. Three flasks were filled with each. In one a piece of iron (80 grams) was placed; in the second mercury (5 grams); to the third no addition was made. With one exception the vessels were not closed, and were allowed to stand in an ordinary well-lighted room from May 7th, 1875, till December 2d in the same year. On the latter date they were examined, when it was found that the sound specimens, without addition, in almost every instance had suffered deterioration to a greater or less extent, and in two or three weevils had made their appearance. The same specimens with iron or mercury were unaltered, save the biscuit with iron, in which a few holes could be counted. The specimens containing weevils originally did not seem to be affected by iron; but mercory seems to have had a decided effect in checking the multiplication of the insects, if it did not destroy them altogether."

Hen's Eggs and Cold.—The degree of cold which a hen's egg can bear without losing its power of development has lately been investigated by M. Colasanti. Having first observed that salt water at ordinary temperature did not affect the development of eggs, he buried some eggs in a freezing mixture of ice and ordinary salt. Of any three or four treated thus, one or other always breaks its shell, and the contents both of these and of the unbroken ones were found solidly frozen. After remaining one or two hours in the mixture (the temperature of which quickly went down to from —7 degrees to —10 degrees C. for 30 to 40 minutes, rising again to —4 degrees or —5 degrees C. by the end of the second hour), the unbroken eggs were taken out, washed and dried, and placed in the hatching oven, having a temperature between 36 degrees and 40 degrees C., and after 10 days they were examined. In every case a normal embryo was found to be developed, without the least trace of anomaly. They were in all respects like the normal embryos of eggs that had been placed in the hatching oven without previous exposure to cold.

Ruined by Rivers.—The *Journal of Chemistry* notes the fact that the French shore of the Mediterranean divides into two distinct parts, which offer a strange contrast to each other. From Genoa to Marseilles all is life and beauty; "all the world" goes thither for pleasure or health. From Marseilles to the coast of Spain, one finds everywhere solitude and desolation. The latter region was at one time highly prosperous, but it has been entirely changed by the immense quantities of sand and mud brought down by the rivers. Narbonne, in the time of the Romans, communicated directly with the sea. It had its lagoon, like Venice, and a deep canal afforded passage to heavy merchant ships and the triremes of the imperial fleet. The lagoon is now blocked up, and the commerce, wealth and activity are all gone. Arles was another very important city; it had two ports, like Alexandria, and was so rich and powerful that a poet of the fourth century spoke of it as the "Rome of the Gauls." The Rhone, with its annual seventeen million cubic meters of sediment, has been its ruin. So with other cities; but while they have become separated from the sea, agriculture is gradually taking possession of the land won from the water, and the vine and olive may yet restore a part of the ancient prosperity.

The Temperature of the Soil.—In the bulletin of the Scientific Association of France, MM. Becquerel gave a report of the observations of temperature made at the Museum of Natural History, during 1875, with electrical thermometers placed in the air, and in soils covered with grass and soils cleared of vegetation. From the results of the last four years it is shown that the mean annual temperature of the two soils, at a depth of 39 inches, and that of the air, is nearly alike; that at depths of 4 to 24 inches the influence of vegetation is to raise the annual mean 0.7° C. above that of soils clear of vegetation; and that during these four years the temperature of soils covered with grass or any other vegetation has not fallen to the freezing point, a fact of no little importance to horticulture.

Cold in its Relation to Hight.—According to some remarks of M. Martins, of Montpellier, cited in the *Belgique Horticole*, the intensity of cold at night diminishes up to a certain hight. This phenomenon was tested by M. Martins by placing thermometers in the Botanic garden and at various hights on the cathedral tower. In clear nights the increased warmth at a higher elevation is the most perceptible; in dull nights there is little or no difference. The reason of the greater injury inflicted on the lower branches of shrubs, etc., is thus accounted for.

generl market and do not at all sympatbize with its improvement, while every sign of weakness in the remsinder of the Comstocks bas been seized upon by tbe bears as an opportunity for further bammering. The story now is tbat tbe grest ore body being worked in Opbir is at lsst showing signs of exhsustion, and tbat new levels will bsve to be opened and new developments msde before tbe montbly returns can be beld up to their recent strength. A quasi strnggle for the control of Ophir and Mericsn has also been thongbt to be responsible for their eccentric course, but as tbe old managements still firmly hold the reins tbere csn be bnt little in this. Probably the principal csnse of tbe decline in Opbir is simply the fact that a prominent operator bss been unloading the stock at a rate wbiob tbe market could not stand. The two bonanza mines do not show sny important obanges. Their yield tbus far dnring tbe month is fully up to the msrk, and refutes the predictions of the bears. It will be remembered tbat for over a year these mines bave been said to be giving out and that their fnture dividends have been sold at a large discount. Yet when esob epoch of dissster is rescbed, tbe mining situation remains tbe same, and tbe propbecies of tbe shorts are sbown to be something like those of the Millerites, wbo are forever postponing the wratb to come until a more favorable sesson.

Business bas been fairly active and shows sn improvement upon tbe aversge transsctions of the preceding week. In spite of tbe low ebb, of qnctations, brokers' orders are plentiful enough to insnre full commissions, and tbe prevailing tone on the street is consequently satisfactory to at least one class. The present condition of the market is sucb as to preclude sny general rise sncb as used to occur in the days before tbe various stocks were watered to exireme dilntion. Wbatever upward moves are put on foot by tbe powers are necessarily confined to one stock or group of stocks at a time, to tbe exclusion of the general market. In the long run, however, tbis amounts to tbe ssme tbing, and is conducive of grester vsrlety by keeping at least one favorite before the people all tbe time.

Mining Share Market.

The unsatisfactory state of affairs still continnes in stock circles. Dnring the psst week tbe ups and downs bave been numerous and freqnent, and on the whole tbe downs have had the best of it, the general market sagging to nnexpected deptbs. The bright exceptions to tbe prevailing depression have been Overman at the soutb end and the gronp led by Best & Belcher, consisting of that stock and its immediate neighbors, Gould & Curry, Savage and Hale & Norcross. Overman is still so closely held tbat its price is easily maintained by tbe management, while late developments in Consolidated Virginia are accepted as giving color to the belief of the extension of the great bonanza ore-body into the territory of Best & Belcher. On the other hand, Opbir has somewbat stsrtled tbe stock-dealing commnnity by tbs snddenness of its last downward plnnge, the priee baving receded from $35 at the beginning of tbe week to $29 on Tbursday afternoon, with many vibrations between these limits in the interim. This stock aud Mexican are at present traveling in a distinct groove from tbe

Ir is rumored tbst tbe New York Central railroad company are abont to extend their freight business to include ocean transportation, snd tbat a contract hss been made witb Jcbn Rosch & Scn for tbe construction of eight iron steamships, of 4,000 tons burden.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR.

Opening a Mine.—Amador *Dispatch*, Dec. 16: We understand that a gentleman by the name of Beck, who has been looking around among our mines for some days, in the interest of capitalists of San Francisco, has procured a lead on Spanish gulch, between this place and Mokelumne river, and will immediately put six or eight men at work to prospect and open the mine. There is no doubt but that rich mines exist between Jackson and the river, if capitalists will only open and work them.

Montierhaan.—Amador *Ledger*, Dec. 10: This mine continues to give evidence as to its permanent character. Toward the end of last week a very rich vein of quartz was struck in the drift 180 feet from the surface. It is about eight inches wide, and fairly studded with gold. The owners are very sanguine over the prospects of the mine, as they have every reason to be. It has more than paid expenses from the start. After every crushing a dividend has been declared. The ore body increases in size and richness as depth is attained. They are now working from six to eight men, and take out from 15 to 16 tons per day.

Volcano Gravel Company are pushing their tunnel through the hill, to tap the Volcano basin, with vigor. The head of the tunnel is now in 200 feet. Twenty-five men are now at work on the undertaking, which makes quite a difference to the business of Volcano. The rival company have ceased running their tunnel, leaving the field in the hands of their more active competitor.

Crown Point is now down 120 feet. The new 10-stamp mill is to be in running order by the first of January.

The Govey holds on its way rejoicing, yielding the richest kind of rock and plenty of it. It is said that no rock has been crushed for many months that did not yield $22 per ton. One year ago the stock went begging at $1.50 per share; to-day it cannot be bought for less than $30. The new 20-stamp mill is about finished, and will be started about the first of next month.

Sylvester Tunnel, on Huat's gulch, is in 180 feet. A contract has recently been let to run 200 feet more. It is not expected to strike the ledge until they get much further into the hill.

Spanish Gulch.—Captain Book reports everything favorable in connection with the mining property purchased by him in this gulch. He has been getting timber to put in the shaft, and also for the erection of a dwelling house. The company which he represents has secured 3,000 feet on the ledge. The croppings may be traced for 1,600 feet, and averages, it is said, 15 or 20 feet in width. The site for a mill is to be surveyed forthwith.

CALAVERAS.

Emerson Claim.—Calaveras *Chronicle*, Dec. 10: The extension of the bedrock tunnel in the Emerson hydraulic, Happy valley, to permit the laying of the flume in closer proximity to the gravel bank, is completed with the exception of a few finishing touches. As soon as the tunnel is fully completed and the flume laid, piping will be recommenced with energy.

New Shaft.—The mill at the Duryea claim, Chile gulch, is temporarily lying idle to permit of the putting in of a new and heavier cam shaft. The mine is now in splendid shape for working, and when the mill is again in readiness no difficulty will be experienced in keeping the stamps constantly employed.

Mount Tmolus.—We hear favorable reports from the Mount Tmolus mine, Jesus Maria district. The mill, a five stamp battery, is kept constantly running, the appearance of the plates indicating a fair quality of ors. Operations in the mine are continued vigorously, the developments made being of a favorable and encouraging nature.

Pipino has been resumed in Valth'e hydraulic, Tunnel ridge, the blast lately put into the upper claim having been exploded. Everything is progressing favorably, and Mr. Velth is well along the road towards another big clean-up.

Upper Country Items.—Mr. Hall, of Ione City, has bought the well known Zacatero mine, at West Point, and is erecting a 10-stamp mill. We also understand that Mr. Hall has obtained the Carey mine, near the Zacetero, and will work rock from both in his mill. A lot of rock from the Japan mine, owned by Williams & Co., yielded an average of $35 per ton. Champion still crushing. Josephine, keeping the water out while waiting for advices from below. Operations are progressing steadily at the Mina Rica, and good ore is being extracted. Splendid rock is being taken from the old Holmas mine, near Mosquito, now owned by Griswold & Co. Ledge four feet thick. Times are very lively in West Point.

INYO.

Local Notes.—Coso *Mining News*, Dec. 16: Work in different parts of the Defiance has been pushed ahead, particularly in the main tunnel and the north raise, developing increased bodies of ores in both. For the furnaces coal and wood is being daily delivered, and it is the intention of Mr. Reddy to start them by the 20th inst. There will be no let up or hindrance to their continuous and successful operation during the entire winter.

Monoo.—Inyo *Independent*, Dec. 29: The Modoo company, Lookout district, are doing a far more extensive business than most people are aware of. Not less than 500 mules, and quite an army of packers, teamsters, coal burners, wood choppers, etc., are constantly employed in furnishing coal and other local supplies. This and the freighting interests combined has built up a little town in Darwin Wash, which is said to be by odds the liveliest in the county. The furnaces are receiving no less than 3,000 bushels of coal per day. The average out-put of one furnace since Oct. 9th, when it was first started up, is close on to 160 bars every 24 hours; a second furnace of the same capacity will soon be in constant operation, and then the daily yield will be over 300 bars, or about 13 tons of bullion, which heretofore has been worth $490 per ton; in round numbers, $6,500 worth every day. The molten metal at the Modoo furnaces is subjected to a skimming process before pouring, by which the copper slag and other valueless bulk is removed, giving the unusual high grade to the bullion. Nearly everything in the shape of ore found in the mine is put through the furnace, reducing the apparent value of the high grade ore, which averages $190 per ton. It is said that this ore taken in the mass is unequaled for the facility with which it smelts; save in one recent instance, caused by an accident, the furnace has never been threatened with a "bank" since it was started.

NEVADA.

Mining on the Ridge.—San Juan *Times*, Dec. 16: John McCarthy, who is mining ground belonging to the Eureka Lake company, between Cherokee and North Columbia, has been making some excellent clean-ups recently. Mr. McCarthy has been working under great difficulties, having a great deal of pipe clay to contend with, and for the want of a tunnel of sufficient depth not being able to reach bedrock. Still, he manages to realize from top gravel a handsome dividend, after paying all expenses. In the neighborhood of Columbia Hill, the Eureka Lake company own claims that, for the want of a tunnel to carry off the debris, cannot be worked properly. The top ground has been washed off and the bottom ground still remains. It has a depth of from 40 to 100 feet and is richer in precious metals than any ground on the Ridge. It is said that a tunnel of 3,000 feet in length will reach said mines and open up that entire section of the country for mining operations. The Eureka company own the key to the position, the ontlet, and with an expenditure of $100,000, or there about, can open up the richest mines on the Pacific coast.

Mills.—Grass Valley *Union*, Dec. 14: We hear it reported that a number of mills for stamping out gold will soon be put up in the neighborhood of Grass Valley. Capt. Godfrey, of the Godfrey mine, on Alta hill, is making arrangements for a mill which will be used for working the gravel which is being taken out. It pays well to mill that gravel. There is a talk that the Central mine, near Granhorn creek, will soon have a mill of its own, to be run by water power. The Kentucky Ridge mine is inclined very strongly toward putting up a mill. The Homeward Bound, as things now are working, will be obliged to have stamps of its own at work as early as May. We expect to hear of more pounding in Grass Valley next year than has ever been here in any previous time. Every indication is in that direction.

Alaska Mine.—Is about two miles south east from Grass Valley, near the Colfax road. The shaft is now down about 200 feet, and 150 feet below the water level. The drift has only been run about 12 feet, but the drift and shaft have in them a ledge which is from 20 inches to two feet thick. The rock shows well, indeed we may say big, la free gold and heavy sulphurets. The owners are very much pleased at their prospects, and Thomas McFate, who is bossing the works, says the ore is certainly "way up."

Foothill Tidings, Dec. 16: Is the name of the new mine discovered out beyond New York hill by the Mullen Bros. and McDonald, reports of rich rock in which we have several times noted. The Pacific is still turning out gold in abundance, as witness ten loads recently crushed which turned out $385 to the load. This strike is said by those best posted to be one of the richest ever made in the district.

PLACER.

Gravel Mines.—Dutch Flat *Forum*, Dec. 14: The weather continues clear and dry, and the supply of water in our various ditches is gradually diminishing. We note that the Summersett claim has started up and is washing nights, using part of the head which runs to the Southern Cross by day. The Franklin claim exploded a blast a few days since, which did splendid execution, crushing and crumbling the face of the bank so that the gravel can now be washed with ease. The new derrick in this claim is a splendid piece of machinery. The mast stands one hundred feet in hight, with a boom 90 feet in length. It is intended to raise out with ease rocks that weigh 20,000 pounds. The actual cost is not made known, but it is estimated at about $1,600. The Baker is being worked with vigor, using water four hours each day. The powder that was in the Indian Hill claim, belonging to the Gold Run D. & M. Co., was a perfect success. It consisted of 900 kegs of powder, distributed in various drifts under the gravel. The pit was funnel-shaped, arched down in every direction, and the powder was forced to lift the mass perpendicularly, which it did with crushing effect. Blasts of this character do not make as many cracks or leave as much loosened gravel on the surface as when they have a face to break, but we predict the bottom is well crushed and will wash off with ease.

Yon Bet Mines.—The Nevada hydraulic mining company are still washing from three different points. The Neece & West company, having completed the necessary improvements in fitting up their claim, have turned on water and are now washing. A bedrock tunnel, 600 feet long, was completed to the Hussey mine last week. This will give the necessary grade to work the mine to advantage.

Remington Hill Mines.—The Rhode Island company having completed a successful season's work in ground sluicing, are now busy cleaning bedrock, undercurrents and ground sluices, which will take one week more to complete, when work will be commenced in their drift diggings and continued during the winter. The Wide West company tapped the channel in their mine last week, by means of a bedrock tunnel 400 feet in length, and are quite jubilant over their success in finding the gravel to be very rich. In opening the drift to commence breasting out, which took two men five days to complete, the gravel taken out by them during that time was washed and yielded $83, thus showing it to be one of the richest drift mines yet opened in this vicinity. This claim is also extensive, having a length along the channel of 2,100 feet, by a width of 1,200 feet.

Quartz Mining Items.—Placer *Herald*, Dec. 16: The Julian, on Jenny Lind flat, below Newcastle, is being worked energetically. The 20 stamp mill is running steadily, and the rock is yielding flatteringly. Close on to 100 ounces a week, we understand, has been the average clean-up since the mill started, several weeks ago. The St. Patrick company's new mill, as fine a mill of its size as there is in the State, is running steadily on good ore from the company's Crater mine. The machinery of this mill, consisting of a rock crusher, 16 stamps, 6 Hendy concentrators and 4 pans, 1 Wheeler and 3 Knox, is run by a hurdy-gurdy wheel only 6 feet in diameter, which wheel is driven by 120 inches of water under 140 feet pressure. The water costs but about $14 per day, whereas wood to run the engine of the old mill cost at least $25 per day. This mill with its modern appliances is run by one-half the number of men that was required to run the old mill. Besides doing its work so much more satisfactory, the difference in the expense of the new mill as compared with the old one will be a big item in the company's favor each month. At the mine a sufficient force is employed to take out ore as fast as the mill can crush it. The Eclipse mill and mine, under the direction of their owners, who are mostly residents of Dutch Flat and Gold Run, are being put in a condition to be operated. C. A. Cooper is putting up a water wheel for the purpose of running a new style quartz crusher. It is the intention, we believe, to devote it mostly to custom work. Mr. Shurtliff, who has been engaged in mining and prospecting in Ophir district for some time, went to work in an old shaft on Duncan hill a month or two ago, and up to this date has succeeded in taking out some $6,000 or $7,000.

SIERRA.

Slope.—*Mountain Messenger*, Dec. 16: The owners of the "Slope," at Port Wine, have found a body of gravel that pays well in the old mine. How extensive it is no one can tell, but the prospects are favorable for quite a large amount of gravel.

Pioneer.—The Pioneer company, of Gress Flat, have completed their tunnel of some 1,700 feet and raised a shaft. They contemplate pushing the tunnel further ahead, but are so fixed that they can work when water comes in sufficient quantities.

Iowa Shaft.—The Iowa shaft only lacked about eight sets of timbers from the bottom, a week ago, and must be nearly down by this time, unless they have met with obstructions in the shape of boulders. They found one some time since that took the workmen 24 hours to blast through.

Forest City.—It really does one good to visit this lively burg and witness the mining operations most everywhere in progress. Plenty of work for all and sure pay is much better than is the case with the suffering millions in the bleak and desolate Eastern regions of the Union. Only last Sunday, the regular monthly pay day of the Bald Mountain company, $6,000 was distributed in gold coin amongst the employes of this single company, most of which ultimately finds its way into the pockets of every business man in town. Your correspondent was shown by Treasurer McNaughton a pailful of coarse gold, worth the nice little sum of $3,000, taken out in driblets with the small amount of water available. This winter's clean-up promises to beat any of its predecessors. Fifty thousand dollars' worth of improvements have been put on the Bald Mountain mine this year, and it is now one of the best fitted gravel digginge on the Pacific coast. Their main tunnel will soon be in 4,000 feet. The most recent added addition and greatest institution amongst the novelties of this city is the engine of the Bald Mountain company. We took a seat in one of the cars, and soon we were rattling over the rails at break neck speed into the lengthy, dark tunnel—as good average time as is generally made on the Central Pacific. In less than three minutes we reached the present terminus, a distance of 3,000 feet. The track is well laid and will soon be firmly settled. The future can only determine what will be all the results of this new era in mining. That far the engine has been a complete success, and under its competent managers it cannot deteriorate in value. South Fork company are laying in timbers for working this winter. No new developments here. North Fork company have thus far expended $70,000. Pay roll last month, $3,200. They are blasting out the creek, alongside the Bald Mountain flume, and are rapidly putting in one of their own. Watson Bayles keeps the boys vigorously at work, but will not be able to reach pay gravel, working nights, days and Sundays, until next June, most probably two lots for water.

TUOLUMNE.

Riverside.—Tuolumne *Independent*, Dec. 16: Work on the Riverside tunnel has been suspended until March, when new machinery will be ready to drive on the work with increased speed. At that time the new Burleigh drill will be ready for operation, and the tunnel driven day and night. The distance to run to reach the shaft is about 600 feet, where the new tunnel will be some 500 or 600 feet below the old workings.

Nevada.

WASHOE DISTRICT.

Con. Virginia.—Gold Hill *News*, Dec. 20: Daily yield, 350 tons of ore. The ore bressts show no difference in the quality of the ore extracted. The ore bodies on the 1400, 1500 and 1550-ft levels show but one important feature or change. That feature is the steady widening of the ore body on the 1550-ft level. The ore at that point has been opened a distance of 60 feet further to the eastward than on any of the levels above, and the east wall of the ledge has not been found. The immense width of the ore vein at that point taken in connection with the ore development in the winze, 147 feet below that point, promises a mine, when the 1650 and 1700 ft levels are opened, of a proportion so magnificent that the most familiar with ore values could hardly estimate its worth. The decrease in the amount of ore extracted has been owing to a loss of the Gould & Curry hoisting facilities. The west drift on the 1650-ft level is in a distance of 461 feet, and will, without doubt, reach the ore vein within the next two weeks. The 1650-ft station at the C. & C. shaft has been so arranged as to permit of the loading and unloading of the ore cars from double-decked cages without having to move the cage after it has once stopped, which is a valuable improvement, saving as it does a great loss of time in the loading and unloading.

California.—Daily yield, 550 tons of ore, keeping the mills crushing to their fullest capacities. The ore bresste end stopes on the 1500 and 1600-ft levels show little or no change, and continue their uninterrupted and splendid yield of rich ore. The ore in the face of the south drift on the 1600-ft level continues of an excellent quality. A splendid air engine of 20-horse power is being placed in position at the deep winze near the south line for the purpose of draining the water. This air engine is the largest of the kind that has yet been put in use in any of our mines below the surface. The flow of water is handled readily by the pumps. The tank station below the 1650-ft level is completed. The main west drift on the 1650-ft level is in a distance of 461 feet, the face in pretty hard rock. It is confidently expected that this drift will cut the ore vein by the 1st of January next.

Gould & Curry.—The erection of the new pumping machinery is being pushed to completion with all the vigor possible. The two hoisting compartments of the shaft have been retimbered from the surface down, and are now in the best of working condition. The pump compartment of the shaft is now undergoing a complete retimbering.

Justice.—Daily yield, 330 tons of ore. This is a little in excess of the number of tons crushed, 30 to 40 tons per day being taken out and delivered at the mills as a reserve in case of a blockade of the roads by storms during the winter. The ore stopes on the 500-ft level continue to yield good ore and are looking well as usual. The winze below this level is also developing a fine body of good pay ore. There is little or no doubt now but this body of ore is the same as that already being worked further to the southward on the 500-ft level.

Julia.—The main south drift on the 1600-ft level is steadily advancing, the quartz in the face showing better with every foot attained. The west cross-cut from the main south drift on the 1500-ft level has penetrated a body of fine quartz a distance of 40 feet. This quartz gives assays ranging from $6 to $20 per ton. The appearances are that it is both widening and improving.

Hale & Norcross.—The pumps have averaged during the past week seven and three-quarter strokes per minute, not a moment of time having been lost in any way whatever. A general gain on the water is evident, although a sudden giving way of some obstruction on some of the lower levels will cause an occasional rise of a few feet. This is the case in both the Savage and Hale & Norcross, and proves beyond a doubt that the head of the flow has been overcome, and all that remains to do now is to extract the water that now fills the lower levels.

North Con. Virginia.—Everything in and about the mine is in the best working condition, and the developments are being pushed with great energy at all points. Sinking the shaft is going ahead at the usual rapid rate.

North Caregon.—Drifting east at the 500-ft level is well started and making excellent progress. It will not take long to run into the main ore vein.

Sierra Nevada.—The south drifts on the 1600 and 1250-ft levels are each steadily advancing in very favorable ground. The flow of water at bottom of main shaft is kept well under control.

Ophir.—Daily yield, 200 tons of ore, keeping the Nevada and Santiago mills steadily running. Sinking the main incline is being pushed ahead with all the dispatch possible.

Bullion.—The face of the cross-cuts on the 1600-ft level are steadily advancing without change. The face of the south drift on the 1500-ft level is in quartz of a lively character.

Overman.—The completion of the new pumping machinery is being pushed as rapidly as the work will permit. The 1300-ft station is nearly completed, and a drift has been started to cut the ore vein at that point.

Belcher.—The south drift on the 1600-ft level is steadily advancing, the face in very favorable ledge material.

Chollar-Potosi.—Daily yield, 100 tons of ore, assaying $30 per ton. This is from the old upper workings of the mine, and there is no change in either the quality or quantity of the ore in the breasts. Sinking the main incline is going ahead two and a half feet per day.

Imperial Con.—The north drift from the bottom of the south winze on the 2135-ft level is still advancing, the face in very favorable ledge material.

Crown Point.—Sinking the main incline below the 1900-ft level is going forward at the rate of three feet per day. There is no water to trouble, and should any be encountered it can be easily lifted with small pumps to the 1700-ft level, from whence it will flow to the drain shaft and be taken to the surface by the big pumps.

Savage.—The large lift pump at the 1900-ft level is in place, ready to start into operation. This pump will save a lift of 250 feet by the small pumps, and will greatly expedite the drainage of the lower levels. The pumps are making slow though steady gain on the flow of water.

Caledonia.—Sinking the main shaft is making good progress. The flow of water is still very strong. The north drift on the 1100-ft level to connect with the Overman south drift is making the best of headway, the face in soft ledge material of a very favorable description.

Florida.—The pump station is completed and sinking the shaft was resumed during the first part of the week.

Yellow Jacket.—Sinking the new shaft is making splendid progress, the bottom is good working ground. The flow of water is light. The connection between the bottom of the south winze and the south drift on the 2040-ft level has been completed, and the drift is now being enlarged preparatory to starting cross-cuts east, and a drift south toward the Crown Point mine.

Leviathan.—Cross-cutting has commenced on the 600-ft level, 380 feet from the working shaft. It is now passing through the black clay foot-wall. Indications are good and ore will soon be expected. Ore has been discovered in the north drift assaying from $10 to $45 per ton.

Lady Washington.—The drift north from the main east drift or cross-cut is now in 27 feet. The ore streak it is following has increased in size, until it now takes one-half of the face of the drift. The quartz is of the regular white Comstock character, and gives fine assays.

Sutro Tunnel.—Total length of tunnel to-day, 14,445 feet. Face of header in soft porphyry with oley seams, which make it rather treacherous and liable to fall when least expected. An accident from this cause, resulting in the death of one miner, and serious injuries to another, occurred on Saturday last. Very good progress has been and still is being made, however, in this material.

Best and Belcher.—A large force of men are employed on the 1500 and 1700-ft levels in enlarging, repairing and putting all the drifts and winzes in the best working condition and at the same time increasing the circulation of air all that it is possible to do by such means.

Ward.—The flow of water at the bottom of shaft is strong, and preparations are being completed for putting in pumping machinery that will master the situation at once.

Darton.—The north and south drifts on the 700 and 800-ft levels are being advanced daily with the most favorable prospects of ore when cross-cutting the vein shall have been commenced.

Kossuth.—The north end south drifts on the 600-ft level are pushing vigorously ahead. The flow of water on that level is still strong, but is gradually lessening.

Mexican.—The north drift on the 1700-ft level of the Ophirites nearly reached the south line, at which it is the intention to start a cross-cut to explore the ore vein.

Imperial.—The tunnel from the ravine is being pushed toward the shaft rapidly, in good working ground composed of clay and quartz, with plenty of water coming in at the face.

Silver City.—The machinery at the head of the incline is about ready to start up, and the incline itself is being got into pretty good working shape once more.

South Comstock.—Main drift east now in 145 feet, and face shows an increase of quartz and other regular vein matter.

Alta.—Sinking the shaft is making splendid progress, the rock in the bottom blasting out finely. Water gives no trouble.

Sncoon.—A trial has been made of the new machinery and everything works finely.

Silver Hill.—The repairs to the machinery were completed three or four days ago. The water has been drained from the main incline and the sinking resumed.

Cosmopolitan.—The various stopes and breasts at the upper and lower levels continue their gratifying ore yield.

Taosan.—The ore in the upraise from the north drift on the 300-ft level is showing a steady improvement.

HIGHLAND DISTRICT.

Furnaces.—Pioche *Record*, Dec. 10: The small furnace at Highland having made a test run with good fluxing material and having produced some 70 bars of bullion, valued at $450 per ton, closed operations for the present on Sunday night. During its run only 300 bushels of charcoal were used. This run was considered so satisfactory that Joe. Roeder and some others have engaged a lot of fluxing material, intending to start again and run the small furnace until the efforts of the large furnace are settled so that can be started. Arrangements are now being made with creditors which will enable the large furnace to be started to work on a substantial basis, so there will be no more trouble.

ELY DISTRICT.

Alps Mill.—Pioche *Record*, Dec. 10: The Alps mill will be in thorough order and at work this morning. The Superintendent, A. J. Blair, intends running through the Tocquorville ore first, so as not to detain those parties here any longer than possible. As the entire stamps will work on this ore, and the capacity of working will be 20 tons daily, this ore will be soon got through with. The ore brought by the Barbee and that from the Bonanza belonging to Wiederhold, is of a superior quality. The results will be several large-sized silver bricks of fine quality.

Sold.—The whim belonging to the Havans mine, of this district, was sold on Monday last to Mr. Barbee, of Leeds. It was packed up and shipped to its destination that day,

WHITE PINE DISTRICT.

Bullion Tax.—White Pine *News*, Dec. 16: During the quarter ending September 30th, 1876, the Assessor's books show that 4,773 tons of ore was reduced in this county, on which the bullion tax amounted to $2,652,65. Nearly the whole of this amount was paid by the Eberhardt and Aurora company.

The Tunnel.—Work on the Eberhardt and Aurora company's tunnel is progressing finely, and is now completed a distance of little over 500 feet. The formation which is now being worked is in the hardest kind of limestone, but notwithstanding this, 36 feet of tunnel was completed last week. Considering the hardness of the rock, Captain Drake says he is satisfied with the progress made, but he hopes soon to have a change in formation of the ground. In any event, he says he has the satisfaction of knowing that the drilling cannot get any harder.

Stenoa rr Rich.—There is an old location on Treasenre hill called the American, which is principally owned by Samuel F. Paul, but for the lack of capital he has not been able to develop it. A few days since, remembering that it was time to do the necessary assessment work for this year, he went to work, and soon thereafter came upon a four-foot ledge of high grade ore. We understand that he is highly elated over his new find and thinks he has a dead sure thing on a bonanza. Mr. Paul is also one of the owners of the celebrated Stafford mine on Treasure hill, which, we are informed, is yielding a large amount of high grade ore.

WARD DISTRICT.

Lively.—White Pine *News*, Dec. 16: We learn from passengers traveling through our town, that business of all kinds is quite brisk with our neighbors at Ward. The Martin White company's furnaces are in full blast and turning out large quantities of bullion. The company's new 20-stamp mill is being constructed as speedily as possible, and it is expected to be finished and running by the 15th of January next. It is said that

Practical Astronomy.

A New and Expeditious Method of Finding a Meridian.

At the last meeting of the California Academy of Sciences, the following paper was read by Mr. T. J. Lowry, of the Coast Survey:

The most approved methods of finding latituds and time are those with the telescope in the plans of the meridian; and hence this plane is the first object of the practical astronomer's search in the observatory. The methods now understood by the astronomer of getting his instruments in the meridian are all trial methods, each of them finding a meridian only by a series of continned approximations, consuming time and effort proportionate to the skill of the observer, the accuracy of the knowledge of his time and latitude and the rapidity of the successives appearance of favorable stars on his meridian.

The method now proposed requires but little practice and less skill to place an instrument in the meridian by one observation only, without any knowledge of the latitude or time except to the nearest five or ten minutes.

The essential idea of this method is to observe two stars of the same, or differing 12 hours in, right ascension, but of different north polar distances, at the instant of their simultaneous passage of our meridian. Now, since our zenith is a point in the plane of our meridian, and since the plane of the declination circle of any two stars of exactly the same, or 12 hours different, right ascensions, is by the diurnal revolution of the earth made to coincide successively from east to west with every terrestrial meridian, it is obvious that we have but to (select and) observe two such stars at the instant that they and our zenith are in the same vertical plane and clamp, and we have our instrument fixed in the plane of its meridian.

To accomplish this

Simultaneous Observation

Of two such stars with a transit, zenith telescope or theodolite, we attach to the tube of the telescope directly in front of its object-glass a plane mirror, half silvered to admit of direct and reflected vision, with its axis of rotation horizontal, parallel to its plane of reflection and perpendicular to the line of collimation of the telescope. Attached to this axis is a small vertical finding circle for setting this mirror at any desired angle with the collimation line. In form this mirror may be either an elliptical ring with only the quicksilver removed (or the glass also cut away) from its center, or that of the ordinary sextant horizon glass with its silvered half uppermost. This mirror should have its front and back faces perfectly parallel and be from one-fourth to one-third of an inch thick, so that by having on its front face two fine lines cut at right angles to each other we can, by making the reflected image of each of these lines coincide with its direct image, adjust its plane of reflection perpendicular to the telescope's collimation line, and thus also find the index error of its finding circle. In this adjustment use the collimating eye-piece.

This method of getting one star of a pair into the telescope field by a single reflection and the other by direct vision will work admirably when the stars differ considerably in north polar distances; but when this difference is small and we point on one of the stars direct it becomes imperative to subject the other to a double reflection, by using an additional mirror as in the sextant, or employing the principle embodied in the Steinheil heliotrope. We may, however, avoid this double reflection of either of the stars of such a pair by pointing the telescope on the artificial horizon image of one of them, and thus get the other into the telescope field by a single reflection.

When the stars of a pair have the same right ascension, we will have them enter the field of the telescope on the same side and move across in the same direction, the faster mover, as it were, chasing the slower and catching up with it at the instant of their simultaneous passage of the meridian. But with a pair of stars differing 12 hours in right ascension, *i.* e., one of them culminating *sub polo*, they will enter the telescope field on opposite sides, move across and meet exactly on the meridian. It is hence obvious that a pair whose stars differ 12 hours in right ascension offers the advantageous feature of the sum of their motions to aid the observer in deciding upon the exact instant of their coincidence in his telescope field, whereas with a pair having the same right ascension he has only the difference of its stars' motions to assist him in fixing upon this instant.

But when the catalogues do not offer star pairs culminating at desirable times, of suitable magnitudes and declinations, and of the same or exactly 12 hours different right ascensions, and thus permitting the application of the method in its greatest perfection, we may yet find our meridian most accurately by selecting and observing suitable pairs, the right ascensions of whose stars differ but a few minutes from being identical, or exactly 12 hours different. Now the zenith of a position is a point common to all its vertical planes, and since the plane passing through the earth's center and any two stars differing more in declination than in right ascension, is, by the diurnal revolution of the earth, made to coincide successively with one of the vertical planes of every point on the earth's surface, we hence have but to observe two such stars at the instant they and our zenith are in the same vertical plane, and clamp, and we have our instrument in a vertical plane whose deviation in azimuth is determined by, and easily derived from, the north polar distances of the two stars, the difference of their right ascensions, and the co-altitude of one of the stars (or our co-latitude), we can observe the co-altitude of one of the stars at the instant of their coincidence in the telescope field. Having selected a list of such star pairs, we can readily compute a table from which an observer at any known latitude can pick out the azimuthal deviation of his instrument in degrees, minutes and seconds, at the instant two such stars coincide in his telescope field. Or instead of using the co-latitude, which must then be known, we can use, in the preparation of such a table, the zenith distance of one of the stars; otherwise we may tabulate the hour angle in time (minutes and seconds) of the hinder of the two stars at the instant of their coincidence in the field of the telescope, either for the different altitudes of this star or for the different latitudes.

The Method of Observing

Such a pair with the aid of the last named table will be as follows: Having taken care in selecting to have one of the pair a star of such magnitude and position as to be readily identified by a stellar chart or alignation, we set the mirror in front of the object glass, at an angle with the collimation line equal to one-half of the supplement of the algebraic difference of the north polar distances of the two stars, and bring the more readily identified one of them into the field of view, and follow it till its mate appears there, either meeting, chasing or fleeing from it. We then "pick the beat" of the watch or chronometer, and beginning to count the beats at the instant the stars coincide in the telescope field, follow the hinder star till the moment its "tabular hour angle" expires, and clamp, and our instrument is in the meridian.

A pair of fast-moving stars will give an accurate meridian, yet practically it will in general be found preferable to have one of the pair a star of slow motion, so that it can be readily bisected and followed till the instant its fast-moving mate strikes the middle wire, thus enabling the observer to clamp his instrument at exactly the right time without a hesitation or doubt.

If the table gives the hour angle in time of the hinder star at the instant the two stars and our zenith are in the same vertical plane, then their relative right ascensions and positions with reference to the zenith must be as follows, viz: 1. If both stars are on the same side of the zenith then the star having the greater zenith distance must have the smaller right ascension, and this rule holds when one is a zenith star. 2. But if one star is south and the other north of the zenith then either may be in advance, but practically it is preferable that the slow mover "bring up the rear." 3. When a star south of or in the zenith is paired with a sub-polar, then the latter should not be quite 12 hours in advance of the former. 4. If a star north of the zenith has a sub-polar mate, then the upper culminating star should transit the meridian first, if it is the lower culminating star that we are following with the cross thread, and *vice versa*.

But if our table gives the azimuthal deviation, in degrees, minutes and seconds, of our instrument at the instant two such stars coincide in the field of its telescope (its plane of motion being, of course, vertical) then it is a matter of indifference which star precedes, since this angular deviation can be turned off either backward or forward on the horizontal limb of the instrument.

Within the latitudes of the United States the following varieties of pairs will offer, viz:

Class A.—Pairs whose stars have the same, or differ but a few minutes, in right ascension. 1. Two circumpolar stars. 2. A circumpolar star and a time star, the latter being either in the zenith or south or north thereof. 3. Two time stars, either one north and one south of the zenith, or both north or both south thereof, or one star in and the other star either north or south of it.

Class B.—Pairs, the stars of which differ exactly 12 hours in right ascension or lack but a few minutes thereof. 1. Two circumpolar stars. 2. A circumpolar star and a time star either in or south or north of the zenith.

With respect to the

Relative Motions

Of the stars of a pair most important to the observer in deciding upon the exact instant of their coincidence, class B is in general more favorable than class A. And the pair in class B which furnishes the maximum amounts of azimuthal motions (in opposite directions) and hence most desirable, is a lower culminating circumpolar star and an equatorial star; while with a pair of circumpolars the sum of these motions is a minimum. And of those in class A, a close circumpolar star and an equatorial star give the greatest difference of motions; while a pair of circumpolars gives the least. When the stars of a pair move in the same direction, and at not very greatly different speeds, they will doubtless be found to cling together in the telescope field a provokingly long time.

As to the frequency of their availability, the pairs of circumpolar stars stand pre-eminent; since they are on our meridian and its visible extension twice in every 24 hours, they are hence doubly more available than the other pairs which transit our meridian but once in that time.

As to the amount of

Computation

Required—an element only in those pairs whose stars are not exactly on the same declination-circle or its visible extension—when a zenith star is paired with either a south or a north star (at upper or lower culmination), following within a few minutes, the computation is a minimum, for then the differences of the times of the stars transiting our meridian equals the differences of their right ascensions; and the zenith star obviously transits the meridian at the exact moment it and its mate are in the same vertical plane. And when its mate is a close circumpolar star their mean right ascensions will prove all-sufficient because from the slowness of its motion in azimuth the error of assuming the difference of their mean, equal to the difference of their apparent, right ascensions will in general be inappreciable. And it may often occur that the error of assuming this of two stars having nearly the same precession in right ascension will enter the resulting azimuth in so diminutive a form as to be quite allowable, except in very close work.

If the stars chosen fall in a part of the celestial sphere illuminated by the sun as they transit our meridian, they will require to be of larger magnitudes than such stars pairs as, being in the opposite part of the heavens, cross our meridian at night. Especial effort should be made to incorporate the double stars into pairs, from the facility and certainty with which they can be identified in the telescope field.

And again, if tables are available giving the exact right ascensions and declinations of Mars and Jupiter, they may be advantageously paired with suitable stars; and their continuous motion among the stars renders them more available, since they cross successively the declination circle of every star in the heavens. But the use of these planets will necessitate a more accurate knowledge of our time.

Experience has proven that, in reconnaissances, rapidity of execution in finding

Latitude, Time and Azimuth

Is all-important and in many cases essential to success; and hence methods and instruments which yield a maximum amount of results in a minimum time are in especial demand. Under the contingency, often arising in reconnaissance and exploration, that the latitude is not known and the time only to the nearest five or ten minutes, and when limited in time and facilities, as the reconnoiterer or explorer *per necessitatem* generally is, then this method will be found most acceptable; for it is obvious that by bisecting one of the stars of a pair (of identical right ascension) with the horizontal thread at the instant the two stars are on the middle vertical thread, and also at this moment noting the face time of the chronometer, that we have the meridian altitude of a star whose declination is known, and hence our latitude, and also the observed time of meridian transit of a star of known right ascension, and hence a chronometer correction, simultaneously with the observation that fixed our instrument in the meridian. Then, with our instrument in its meridian, the error of our chronometer, and our latitude, we can if desirable proceed at once to the observation of additional stars for a closer time and to test our latitude and azimuth.

A reflecting circle or sextant mounted on an alt-azimuth stand is *per se* (*i. e.* without an additional mirror) the instrument most convenient and ready for finding by this method the

Meridian, Latitude and Time

For the reconnoiterer, explorer or land-surveyor; and it may be found especially serviceable in hydrographic and geographical reconnaissances, whether in the course of an exhaustive survey, or only a flying reconnaissance of a coast or continent.

And from the readiness with which this method places "the transit" and "zenith telescope" in the meridian it will be found useful and may prove acceptable to even the most conservative practical astronomer.

Mr. Lowry finds that the B. A. catalogue offers an abundance of star pairs of suitable magnitudes, declinations and right ascensions. With the mean places of stars brought up to Jan. 0. 1877, between the sidereal times 0h. 07m. and 0h. 57m. he finds 6 pair stars differing less than 3 seconds in right ascension, 4 pairs less than 7 seconds, 7 less than 16 seconds, and 5 less than 29 seconds.

A yet neater method of getting a meridional plane is to select 3 stars so that stars A and B are of same declination and differ 10 or 15 minutes in right ascension, and star C differing several degrees from them in declination, but with a right ascension equal to one-half of the sum of those of stars A and B. Now observe the coincidence of stars A and C in telescope field and read horizontal circle, and then the coincidence of stars B and C in the field of view and read the horizontal circle, then set the vernier at the point midway between these horizontal circle readings and our telescope is in its meridian.

Work on the Eberhardt & Aurora company's tunnel, through Treasure hill, is being vigorously prosecuted.

Pacific Coast Railroad Items.

The second division of the Northern Pacific Coast railway is completed, and this line is now open to Moscow, on the Russian river, 85 miles from San Francisco. Work was begun on the road in the fall of 1873, and Tomales, the terminus of the first division, was reached in June, 1875. The whole cost of the road, including depot buildings, ferry slips, fencing and ballasting, which items were not part of the contract work, and also including the rolling stock now on hand, amounts to, in round numbers, $2,000,000, or about $25,000 per mile. In the construction of the new division, iron of superior quality, of greater weight, larger ties, and the latest appliances for fastening, etc., have been used, although the material used in building the first division has so far proven satisfactory in every particular. Since the first day of its operation, the receipts of the road have uniformly exceeded its expenses. The rolling stock now on hand consists of 11 locomotives, 13 passenger cars, and 300 freight cars. Additional and superior passenger equipment will be ready by the opening of next spring, and the company are now building at Saucelito some 200 more flat freight cars for the wood and lumber trade. As an illustration of the perfect safety of this road, it may be stated that last year, when only the first division was in operation, a freight train was ascending the grade 22 miles from Saucelito. On this grade occurs the sharpest curve on the whole line—24 degrees. A flat-car, partially loaded with grain, became detached from the train in switching at the summit of the grade, and dashed down the hill, around the curve and on for about eight miles until a steep counter grade was reached, in the vicinity of Ross valley. The speed of this runaway car was so great that sacks of grain were flung hundreds of feet from the track, not one remaining throughout the trip, yet neither car nor track were injured in the slightest degree. Engineer Wade says that 24 miles of the road, the upper end, is as well built as any road on this coast, being laid with 50 pound iron, and 3,000 ties to the mile. And 10 miles of it is as heavy work as is to be found in the country. There is one tunnel 1,700 feet long and one 400 feet long. The trestle over Tomales creek is 640 feet long and 76 feet high; the trestle over the Estero Americano is 750 feet long and 25 feet high; the bridge over Brown canyon, near Freestone, has two spans of Howe truss, 150 feet long each, and at the giddy height of 137 feet above the bottom of the canyon. The track runs over the top of the bridge. The central pier of the bridge is 110 feet high, of the kind called a cluster pier, and is a splendid piece of mechanism.

On Saturday last the surveys for a new line for the narrow-gauge from San Rafael to Saucelito were completed. Three routes have been surveyed, all being the same from Saucelito to the north end of the Reed tunnel.

William Hood, chief assistant engineer of the Southern Pacific railroad, arrived in Fort Yuma on the 8th with a surveying party, having left the end of the railroad 10 days before. They came to complete surveys commenced last summer in and about Fort Yuma and vicinity; also to take the soundings, etc., of the Colorado river, preparatory to locating, crossing and building a bridge for the Southern Pacific railroad.

Referring to the Ione railroad, the Amador *Dispatch* says: The cars on the Galt & Ione railroad have commenced making regular trips between those two places, and the stages from Jackson and Mokelumne Hill now connect with the trains at Ione. By this arrangement we are now enabled to get our evening mail about two hours earlier than heretofore, the Ione stage reaching Jackson at six o'clock P. M. instead of eight. There has also been a slight reduction in the rate of fare; the fare between here and San Francisco being now $8.25, instead of $9, the price formerly charged. Another convenience that will be experienced by passengers, aside from avoiding the long and tedious staging over the plains, is the fact that they will not be compelled to start at such an early hour in the winter time. The stage now leaves Jackson about seven o'clock in the morning, and passengers can now make the through trip to San Francisco by daylight. A time-table will probably be published soon for the convenience of the public.

The New Mines Near Death Valley.—A new road from Mohave to Death valley, the neighborhood of the mines now attracting so much attention, is being surveyed by a party under the direction of Mr. Anson Cross. The freights of that section are now hauled out from San Bernardino, a distance of 250 miles, and it is believed that the distance from the railroad at Mohave to the same place is less than 100 miles. The road lies across the desert through sage brush and has no obstacles save scarcity of water. In a direct line it is said to be no more than 70 miles, but the want of water will require a change in direction till some steps are taken for sinking wells.

The Resting Springs mines are now turning out ten tons of bullion per day, all of which should come this way, and the teams for hauling the product should be supplied from the valley. Colville is attracting a great deal of attention. The excitement occasioned by new and valuable discoveries is spreading over the coast counties, and especially among the mining population of Inyo. At no time in the history of the county has there been such a general movement towards the mineral districts on its borders.—*Courier-Californian.*

The Lincoln Pottery.

We enjoyed the other day, says the Placer *Argus*, the privi'sge of a brief visit to the Lincoln pottery, or rather sewer-pipe works, and were shown through the building by Mr. Gladding, the resident proprietor and manager. These works were located at Lincoln only e few months ago, the inducement being the exhaustless beds of superior clay, and the supposed plentiful supplies of cheap fuel to be had from the coal mines at that place. The clay-beds have turned out, both in quality and accessibility, all they were represented to be; but the coal mine bes ceased operations, and the pottery has had to look elsewhere for fuel. Happily the adjacent foothills furnish plenty of good wood, and some 600 cords of this are now stacked up in the yards, while 2,000 cords more have been contracted for. The building, which has been twice enlarged, is now 260 feet long, and about 70 feet wide. It is supplied with all the most approved machinery for the making of sewer-pipe of all sizes, the whole being driven by an engine of ample power. The clay press has a 40 inch steam cylinder, being one of the very largest used for that purpose. At present there are three large kilns for burning the pipe, but another will be built early in the spring, and as the business is growing rapidly more will have to be built soon The present capacity of the works is 15 tons of clay per day, and it is found impossible to keep up with the orders. The pipe manufactured is exclusively for sewer purposes and for connecting house drains. Its superiority over the cement pipe, still largely used in San Francisco, is so manifest that it will not take long to supersede that article entirely. In the Eastern cities the vitrified earthen pipe is used altogether, and the demand for it is large and steady. Here it cannot help becoming so large as to require an indefinite extension of the works at Lincoln, and the establishing of a manufacturing industry that will greatly benefit our county. In addition to the sewer-pipe, fire brick of excellent quality are made, though at present, owing to the low price at which they are sold in San Francisco, the establishment does not attempt to supply more than its own wants. Vessels coming from England to load with wheat bring fire brick as a ballast, and this enables them to be sold at less than we, with higher-priced labor, can produce them for, but this will regulate itself in time, when the manufacture of fire-brick will become an important branch of the business. During the summer just ended, the pottery has given employment to 45 hands, but since the rains have set in the green pipe dries more slowly, and now but 35 are required to keep up with the rate of production. As the works are extended, the number of employees will increase, and in a few years they will out-number those required by all the other industries of the place.

MERCURIAL SALIVATION.—So much quicksilver is used about our mills that it is a wonder more cases of salivation do not occur. Men generally handle quicksilver carefully, knowing that it is harmful, but they are not sufficiently acquainted with it in all conditions to guard against inhaling it to an injurious extent occasionally. A case wherein carelessness or ignorance was displayed in the use of mercury is reported from the Woodruff mill. A man but little used to milling business made a fire, a short while ago, with some wooden shoes that had been used in the amalgamating pans and which were full of mercury. Himself and another man sat about the fire until they began to feel the effects of the inhalation. Soon after they were both taken down, and the salivary glands of one now abnormally excited, and his mouth and gums are now so sore that he can scarcely eat or speak. The other man is differently affected, and has no trouble with his salivary glands. Mercurial salivation operates differently on different persons. Some it effects most about the mouth and face, while others feel it through the whole system. Men who handle mercury should remember one point, and that is, that it evaporates at a moderate temperature, and volatilizes completely at a high temperature. Mercury is constantly evaporating from heated amalgamating pans, but so slowly that with the least caution one never need inhale enough of it to make him sick.—*Lyon County Times.*

ANTIMONY ORE.—Three teams belonging to E. Reinhart & Co., which left here some time since loaded with flour for Austin, returned today loaded with antimony ore. This ore is from the extensive mines recently discovered in the southern part of the county, near the Austin road. The three teams brought in some 20 tons of ore, and W. H. Howard, who accompanied them and examined the mines, informs us that they are very extensive. The ore contains about 70 per cent. antimony and 25 per cent. sulphur. The mines are owned by Messrs. Graves, Goodall and Healy.—*Silver State.*

CENTENNIAL MACHINERY.—The cage and car and other mining machinery, which were sent to the Centennial from Gold Hill, returned by this morning's train. The cage and car were manufactured here under orders from Captain T. G. Taylor, superintendent of the Yellow Jacket mine, and are of first-class make and material. They were used in Philadelphia to illustrate the practical workings of our mines. It is understood that the cage is to be purchased by the Yellow Jacket company, and will be henceforth used in that mine.—*Gold Hill News.*

USEFUL INFORMATION.

How to Make Filters.

Prof. E. W. Hilgard writes to the Nepe *Reporter* as follows: In view of the continued complaints of bad water in your city and in other places where malarious, or rather, perhaps, "malaqueous" diseases are or have been prevalent this season, it seems worth while to suggest that the small amount of water necessary for drinking purposes even in the most temperate household is so readily purified by the simplest means, that there is scarcely an excuse for not so purifying it whenever there is reason to suspect that its impurities are likely to affect injuriously the health of the inmates. The boiling to which the water used in making soup, tea, coffee, etc. is subjected, will in most cases so far remedy its injurious qualities that its purification is not a matter of so much moment as is that of the portion which we drink "straight."

A common water bucket provided with a layer of clean gravel, say pea size, an inch thick, then an inch of sand, coarse below, growing finer above; then the rest of the bucket filled with charcoal pulverized to the size of blasting powder, but the dust sifted out—constitutes a filter that will effectually purify all the drinking water of a family for a week or two.

Of course it is better to have a larger and more permanent arrangement, in the shape of a tall barrel or tank fitted with a double bottom, on top of which the gravel, sand and charcoal are successively placed. It is conveniently covered with a tin pan fitting the top, into which the water may be poured, and from which it seeps slowly through a sponge closing a strainer in the middle of the pan, into the charcoal below. A filter of this kind is very generally used in the Northern States, and a 30-gallon one will serve a family for six months before it needs replenishing, unless indeed the water put in the top be too foul to be fit for human use in any case.

The charcoal not only frees the water from impurities of a vegetable or animal origin, but it also diminishes materially the amount of mineral matter which sometimes renders waters unfit for daily use.

The omission of so simple a precaution where there is even a chance of contamination of water, is scarcely excusable after we have been taught by the labors of the English sanitary commission that fully 90 per cent. of all cases of typhoid fever are referable to preventable contaminations of air, water or food. Diphtheria is in the same category; and it will hardly do to talk about "providential" dispensations when we are only reaping the direct consequences of our own improvidence. Ventilate and disinfect by all means; but above all don't go on drinking liquid poison in every glass of water.

Sawing Granite.

Among the interesting things that were shown to the architects in Philadelphia, during their convention, says the *Building News*, was the patented process of Messrs. Struthers & Sons for sawing granite. Hitherto it has been found impracticable to cut granite with a saw, since the ordinary sand process would cut only an inch and a half or two inches per day. The inventor of the Messrs. Struthers' process hit upon the idea of using chilled iron, finely divided, instead of sand. A jet of steam is directed upon a fine stream of melted iron, and blows it into spray, just as in the common atomizer a jet of air pulverizes, so to speak, the stream of liquid upon which it is turned. The iron, divided into fine globules of, say, a fortieth or a fiftieth of an inch in diameter, falls into cold water and is chilled into excessive hardness. It is used under a saw of soft iron, and with a stream of water, as sand is used in sawing marble. Most persons would have supposed that the scratching of angular grains of sand would be more efficient than the rolling friction of globules of iron; but it would seem that the sand is speedily crushed into dust, while the tough iron, simply wearing down into smaller and smaller globules, crushes its way through the felspathic and other crystals of the granite (which with us is usually syenite, by the way, and not granite). The rolling of the globules is curiously shown by fine channelings or flutings, which score the under edge of the saw from end to end. By this device granite can be sawn at the rate of three or four inches per hour, and at small expense, the waste of the iron being about three pounds for every square foot of kerf, or two square feet of sawn surface. For small blocks, where a saw can be used that is short enough and therefore stiff enough to bear a heavy pressure without buckling, it is found possible to cut at the rate of 12 or 14 inches per hour. The surface obtained by sawing is vastly better prepared for polishing than a hammered surface, not only because it is smoother, but because by hammering the surface of the stone is "stunned," as it is termed; that is, the crystals are so bruised and shattered below the surface that it is necessary, before the polishing can begin, to grind away an eighth of an inch or more, which is unnecessary with a sawn surface.

VANILLIN FROM PINE TREES.—M. Bouquet de la Grye, on presenting to the Agricultural Society of France two samples of vanillin derived from the sap of the pine, made the following remarks: One of the samples is vanillin in a pure state, whilst the other is prepared for the use of the confectioner. Vanillin exists in the sap of the pine (*Pinus sylvestris*) and of the larch. The first attempts at its extraction were made by Hofmann, but on a small scale. The price of vanillin, though high, in consequence of the operations necessary for its extraction and purification, is still lower than that of natural vanilla. The difficulty lies in procuring the sap. For this purpose the trees are felled during the period when vegetation is most active—in May and June—and stripped of their bark. They are then immediately scraped. The product of this operation, collected in vessels of tinned iron, is immediately heated on the spot to prevent fermentation, filtered, concentrated and allowed to cool and settle. A substance is thus obtained which resembles powdered sugar, and which is known as coniferin. This is a stable compound, and is sent in barrels to Paris, where the vanillin is extracted.

Nickel Plating.

The *Manufacturer and Builder* gives the following recipe for cheap and practical nickel pleting: The necessary apparatus is by no means expensive: a small battery of two cells, an oblong wooden tank of a size to suit the article to be plated, coated inside with asphalt, and then filled with a nickel solution, nickel plates for anodes, and brass rods to suspend your plates and goods from, polishing and buffing lathes, with rouge and crocus, as well as vessels for an acid, an alkali, and a soft water bath for cleaning the work before putting it into the solution, which is required the same as in silver-plating, and you are fitted up to commence work. In order to obtain the best results, it is necessary that the solution should be as nearly neutral as possible, and the double sulphate of nickel and ammonia is more generally preferred as being the most reliable and practical, giving a softer metallic deposit and a smoother surface, which can be polished more readily than that obtained from other solutions. Dissolve three-fourths of a pound of the double sulphate of nickel and ammonia to each gallon of pure water, and the solution is ready for use. The specific gravity of the solution should be kept up to about 6 deg. of Beam. hydrometer. When using a solution prepared with the double sulphate of nickel and ammonia, a solid, coherent, tenacious and flexible nickel can be deposited to any desired amount, thus rendering the electro-deposition of nickel practically valuable. The metal deposited from the double sulphate of nickel and ammonia gives the full equivalent of metal for the electricity employed. If with this solution a battery power is used of an intensity of two groove cells, or thereabouts, a white deposit is obtained. The use of a battery of too high an intensity should be avoided; it is important that the depositing shall not be forced by the use of too strong a current. The anode of the depositing cell should present a surface to the action of the solution somewhat larger than the surface upon which the deposit is being made, particularly in the double sulphate solution. The reason is, that nickel dissolves so slowly, that if the exposed surface is not larger than the surface on which the deposit is made, the solution will not keep saturated. With pure solutions and sufficient anode surface, the deposition of nickel can be carried on continuously, and as surely and certainly as the deposition of copper from the common sulphate solutions.

FIRE-PROOF SHINGLES.—A writer in the *Polytechnic Review* says: A gentleman in Philadelphia has effected arrangements for practically introducing, upon a large scale, an extremely simple and excellent process for impregnating shingles with antiseptic and non-combustible substances, the immediate object of the process being to prevent the destruction of shingles by rot, and to render them proof against fire under ordinary contingencies.

GOOD HEALTH.

Hints On Bathing.

The following is an extract from an interesting paper read by Dr. Thomas Bond at an "education conference" of the society of arts, in London: In taking a cold bath in the morning the surface of the body should be warm and moist; therefore the bath should be taken immediately on rising from the bed, and before the surface of the body has had time to cool, or the capillaries to contract. The shock of the cold water should cause them suddenly to contract, then quick reaction will take place in the same way as after a Turkish bath. Unless this reaction occurs after the bath there is great danger of getting a chill; at any rate the full benefit of the bath is not obtained. Persons with weak circulation, who cannot take an ordinary morning bath, often derive great benefit from the Turkish bath. It opens the pores and improves the circulation of the skin, so that the shock of cold water can afterwards be borne. The same person can generally bear a cold bath if they get for a few minutes into a warm bath first, and then immediately plunge into cold water. By these means an active reaction is brought about. Warm baths should, in my opinion, never be taken on rising except under the above conditions, but warm baths at night are often desirable. They should be taken just before going to bed, when they have the effect of relaxing the muscular system and of promoting sleep by soothing the activity of the brain by the withdrawal of blood from it. I do not think warm baths at night are weakening, as the depression of vital energy which may occur is recovered during sleep. In river and sea bathing, persons should be careful not to remain in the water too long, nor should they exert themselves sufficiently to cause exhaustion, as the power of reaction is much impaired thereby; neither should persons get into cold water when cooling. The old-fashioned idea that persons should wait to cool before plunging into the water is a fallacy. There is no danger in plunging into the coldest water in a state of profuse perspiration, if the heart and arteries are in a healthy state. Of course it would be unwise to do so immediately after a full meal, as the action of the heart might be impeded by the distended stomach.

Cure for Hiccoughs and Colds.

EDITORS PRESS:—Having seen your clipped article, credited to Pottsville *Miners' Journal*, entitled "Hiccoughing to Death," I deem it a boon that price will not measure or gratitude fathom in the breast of the afflicted sufferer, when he is informed that "veratria" powder, when agitated in a vial and the stopper removed, and the dust thus raised smelled up into the nostrils, so acts upon the mucous membrane, as a stimulant, as to stop the hiccough, so that he will not hiccough another single time after so inhaling the powder through the nose.

Nothing can possibly be a more perfect success than the effect of the above remedy. "Veratria" is a salt chemically produced from the medicinal herb, white hellebore. I would say that "veratria," used in the same way, is beneficially employed in colds, where the nostrils are closed or where the eyes are rendered heavy by a stoppage of the lachrymal or tear ducts, and also produces sneezing, which is nature's simplest remedy to clear the organs of the head when oppressed by a sluggish action of the emunctories of the part. We have seen a case of 80 hours' constant distress and many other more ordinary cases of hiccoughs cured as above stated. It can be procured at any drug store. EMORY L. WILLARD, M. D.

S. F., Dec. 9th, 1876.

Do Not Give Opium for a Cold.

Hall's Journal of Health cautions against the use of opiates for colds. It says: Cough, in a cold, is nature's effort to eject from the lungs what does not properly belong there; precisely as when a crumb "goes the wrong way," that is, into the windpipe instead of the stomach. In each case opium diminishes the sensibility of the parts so that they do not feel the presence of the offending particles, and nature is cheated. Any one can see that because a dose of morphine quiets the cough from a crumb in the windpipe, it does not "cure," it does not bring it away. Most precisely so is it with phlegm in the lungs; it has the effect to keep it there to accumulate, just as water does in the spout of a pump, when little boys close the mouth of it with their hands, pumping on all the time. Here the comparison ends. However long the water is kept in, it is water still. Not so with phlegm in the lungs; every instant it is kept there, the heat of the parts being 100 degs. Fah., it evaporates, becomes less watery, and of consequence more tough, harder to dislodge, increasing in bulk by accumulations which also grow thicker by evaporation, until "the pipes" are plugged up with tough phlegm so that the air passes it with increasing difficulty, and the patient wheezes like—an asthmatic; the lungs labor fearfully for breath, they cannot get enough air, hence the blood becomes impure and thick, and in this condition goes to the heart, which labors to send it on through the body, but cannot wholly empty itself at each beat, as is natural; and the blood still pouring into it from the lungs, it gets preternaturally full, hence its fibers are relaxed and then distended: this is "enlargement of the heart." For a while nature struggles to relieve herself of this surplus, until the laboring heart has expended all its strength in the vain effort, until it cannot give another beat, and suffocation is the instantaneous result.

DISINFECTANTS.—*Nature* says: A committee appointed by the Russian government at the St. Petersburg medical academy, to investigate various proposed antiseptics and disinfectants, have arrived at the following conclusions: 1. Carbolic acid is the most efficient means against the development of ammoniacal gas, putrescense, and development of lower organisms in organic matter under decomposition, and is therefore the best antiseptic. 2. Vitriol, salts of zinc, and charcoal, are the best means for deodorizing matter under putrefaction. 3. The powders of Prof. Kittary, besides the properties they share in common with other carbolic disinfectants, deserve attention because of the isolated state of phenol in them and their contents of quicklime, which absorbs moisture—the principal condition of each kind of putrefaction—as also some part of the gases. 6. Chloride of lime and permanganate of potash quickly destroys the lower organisms in putrid liquids. 7. The disinfectants certainly retard the putrid processes in organic bodies, but their influence is only temporary; as a means of purifying air in dwellings their influence is very small, if not totally *nil*, because of the very small degree of concentration of their ingredients that can be used without injuring the health of the inhabitants. 9. For uninhabited buildings the best disinfectants are nitrous acid and chlorine.

MINING AND SCIENTIFIC PRESS

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

One inch..... 1.50	4.00	12.00	40.00

Four weeks are rated a month.

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper inserted at special rates.

Subscriptions payable in advance—For one year, $4; six months, $2.25; three months, $1.25. Remittances by Registered letters or P. O. orders at our risk

Sample Copies.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription.

The Original Articles in this paper are mostly set in solid type, giving in our columns one-third more reading than is contained in ordinary leaded matter.

Address all letters to the firm, and not to individual members, or others, who may at any time be absent from our office.

Our latest forms go to press on Thursday evening.

San Francisco:
Saturday Morning, Dec. 23 1876.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Improved Hydraulic Nozzle; Academy of Sciences; Christmas. 409. The Dralnage of the Comatock Lode, 416-417. Book Notices, 417 Comstock Papers.—No. 13; Items of Interest from the Mines; Patents and Inventions; Notices of Recent Patents, 420.

ILLUSTRATIONS.—The Drainage of the Comstock, 409-416-417

CORRESPONDENCE.—The Lixiviation Process, 410.

MECHANICAL PROGRESS.—How to Sharpen a Screw-Driver; Improvement in Telegraphy; Casting a Statue; Iron Steamships; The Dish on Wagon Wheels; Experiments in Lubrication Desired; A Snow Melting Machine; Danger of Portable Steam Boilers 411.

SCIENTIFIC PROGRESS.—The Great Pyramid; Alhertite; The Satellite of Neptune; Insecticides; Hen's Eggs and Cold; Ruloed by Rivers; The Temperature of the Soil; Cold in its Relation to Hight, 411.

MINING STOCK MARKET.—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments; Meetings and Dividends; Review of the Stock Market for the Week, 412.

MINING SUMMARY from various counties in California and Nevada, 413-420.

USEFUL INFORMATION.—How to Make Filters; Sawing Granite; Vanillin from Pine Trees; Nickel Plating; Fire-Proof Shingles, 415.

GOOD HEALTH.—Hints on Bathing; Cure for Hiccoughs and Colds; Do Not Give Opium for a Cold; Disinfectants, 418.

MISCELLANEOUS ARTICLES. — Miners' Wages; The St. Lawrence Mine; The Richmond Company; The Baker Gravel Claim, 410. Practical Astronomy; Pacific Coast Railroad Items, 414. The Lincoln Pottery; Mercurial Salivation, 415. Silver; Comstock Bonanzas; Pacific Coast Appropriations; Kern County Mines, 418. Meetings and Elections; New Incorporations, 420.

Bullion Shipments.—Since our last issue shipments from the prominent mines have been as follows: Con. Virginia, Dec. 14th, $14,387.94—total since dividend, $996,388 72, on December account; Chollar, 13th, three bars of bullion, $7,605.93; Manhattan, 12th, 12 bars, value $11,086 26; Leopard, 14th, value $5 600; Modoc, 12th, $45,100; Con. Virginia, 14th, $140,540.79; California, 14th, $57,902.75—total to date, $136,839 32; Northern Belle, 12th, $12,002.03—total to date, $30,006.99; Ophir, 14th, $14,346.28; Hackberry mine (A. T.), 15th, $5 000—total to date, $13,000; Gila, 10th, $4,449.62; Leopard, 14th, $5,600; K. K. Con., 13th, 4,000—total to date, $23,250; Indian Queen, 12th, seven bars, $9,799.61; Con Virginia, 16th, $65,306 89—total for November account, $1,202,236.40; California, 16th, $94,962.49—total to date, on December account, $231,801.82; Tyho Con., 12th, $8 986 65—total to date, $17,546 68; Northern Belle, 14th, $10,025.29; Manhattan, 14th, $11,683 62; Indian Queen, 15th, $2,106.66; K. K. Con., 15th, $4,000—total to date, $27,250; Arizona, 17th, three bars bullion, value $2,871 66; Modoc, 16th, 467 bars—total to date, $6,490; Leopard, 19th, $4,100.

General Crook, in his annual report, says: Miners in the Black hills did not violate the Sioux treaty until the Indians had ceased to regard it. He thinks the government has treated the Sioux with unparalleled liberality, which they repaid by raids along the border of the reservations.

Charles E. Chenery, commercial editor of the San Francisco *Chronicle*, died on Sunday last.

"Mechanical Ore Concentration and Separation" will be continued next week.

Late advices report a threatened revolution in the Sandwich Islands.

The Drainage of the Comstock Lode.

[Written for the Press by P. Aug. Humbert.—No. 3.]

Usual Modes of Applying Steam Power in Surface Engines to do Pit Work.

Having seen that momentum is the principal difficulty in pumping engines working at great depths, we will now examine which design of pumping machinery removes mostly this defect.

In this examination we will make no difference between compound or single-cylinder engines, as this question has already been sufficiently canvassed. Consequently we have only two principal divisions to make, viz.:

I. Geared engines.

II. Direct-acting engines.

In applying the power of direct acting engines three cases present themselves:

1. Pumps and engine have the same stroke.
2. Pumps have a longer stroke than the engine.

Pump Stroke Shorter than Engine Stroke. Proportion, 7 to 8.

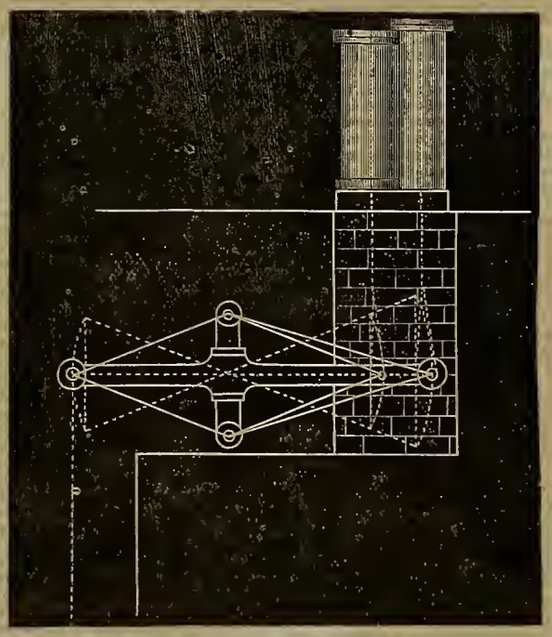

FIG. 18.—VERTICAL COMPOUND ENGINE.

3. Pumps have a shorter stroke than the engine.

I. The Geared Engine.

Up to within two years no other engine was known on the Comstock for pumping.

Figures 12 and 13 represent two geared engines. The horizontal engine is generally used. The Savage mine had a beam vertical engine, the only one on the lode.

Although the question of momentum has till now played but a small part in this system of engines, it, however, exists in the same proportion, and it will be found that on most engines now running it has been totally disregarded.

If a calculation is made of the work performed by the pumps, and this compared with the work the engine ought to do at the steam gauge pressure and the degree of expansion used, it will be found a loss often amounting to 150 per cent. exists. By experiments made on the Savage engine and pumps, the friction in the pumps, compared to the power of the engine as taken by indicator cards, has been found by myself to be not over 25 per cent.; there would therefore be, minus the friction on the gear, 125 per cent. to be accounted for. This will be found to exist in the following circumstance:

Considering the gear to be three to one and that to start the pumps with the mass a steam pressure of say 60 pounds is required, during the second third of the pump stroke a certain momentum having been imparted to the pit-work, not more than 40 pounds is necessary, and during the last part of the pump stroke, say, only 10 pounds are required, so that the average pressure on the steam piston would be 60+40+10 divided by 3, equal to 36⅔ pounds during the whole pump stroke, instead of 60 pounds, which is calculated on in the first instance, accounting consequently for the difference found to exist between the work of the pumps and that of the engine. This decrease of pressure has to be attained by the usage of a centrifugal regulator, so that if the pumps are to make 12 strokes per minute the engine would be set to 36 revolutions. The increase of speed given to the engine by momentum imparted to the mass is followed by a throttling of the steam, and by this means a decrease of the pressure on the engine piston is arrived at.

We know that by this means of decreasing the pressure a loss of power must occur, and that the regulator, striving at every part of the stroke to keep an equal speed on the engine, the momentum spends itself but very little, and that while but a small benefit is derived as far as expansion is concerned, all the defects of strains exist.

II. Direct-Acting Engines.

The figures 14, 15, 16, 17, 18, 19 and 20 represent the different modes of applying the power of the engine to the pit-work in direct-acting engines.

It will be seen from these remarks that the same conclusion is to be arrived at as in the direct-acting engine, to-wit:

Decrease of feet of pump speed as depth increases, requiring to augment the proportion of the gear, equal to a lengthening of the stroke in direct-acting engines, and that with all these difficulties it is impossible to acquire a correct usage of steam.

It may at once here be stated that whilst for small depths, where momentum comes but little in consideration, they are a very good system of engines. For great depths, such as exist on the Comstock, they are totally out of place, and the accidents which occur so often with this system prove practically what theory demonstrates.

It will be found that they are more expensive as far as fuel and running expenses are concerned, when working at great depths.

We have sufficiently examined the difficulties arising from the momentum in direct-acting machinery, and it behooves us simply to state which of the three appliances of steam is most desirable in pumping machinery, as regards reducing the momentum and increasing the delivery of water from the pumps. To demonstrate this we take as example a 14-inch pump, 5-foot stroke, engine 10-foot stroke, and compare it with a 10-inch pump, 10-foot stroke, with equal engine

FIG. 14.—BULL ENGINE.

stroke. It is clear that the 14-inch pump, being double the area of the 10-inch, will throw as much and the speed will be one-half that of the 10-inch pump, which we will consider the mass twice as great. Let w represent the weight of rods and water column for the 14-inch pump and v its speed, while w_1 and v_1 will represent the same quantities for the 10 inch pump, further, we will place:

$w = 2$ $v = x$ feet per second.
$w_1 = 1$ $v_1 = 2$ feet per second.

To find the average speed of the 14-inch pump compared to the 10-inch pump, we must make the energy of both masses equal; consequently, $w\,v^2 \div 2g = w_1\,v_1{}^2 \div 2g$, or $w\,v^2 = w_1\,v_1{}^2$ $2g \div 2g$, or $w\,v^2 = w_1\,v_1{}^2$; consequently, $v^2 = x^2 = w_1\,v_1{}^2 \div w$, or $x =$ sq. root of $w_1\,v_1{}^2 \div w$. By placing in this equation the numbers which the letters represent, in this case we will have: $x = v =$ sq. root of $1 \times 4 \div 2$, or $v =$ sq. root of 2, or $v = 1.4422$ feet per second.

To throw the same amount of water the speed of the 14-inch pump only requires to be one half of the 10-inch pumps, or one foot per sec

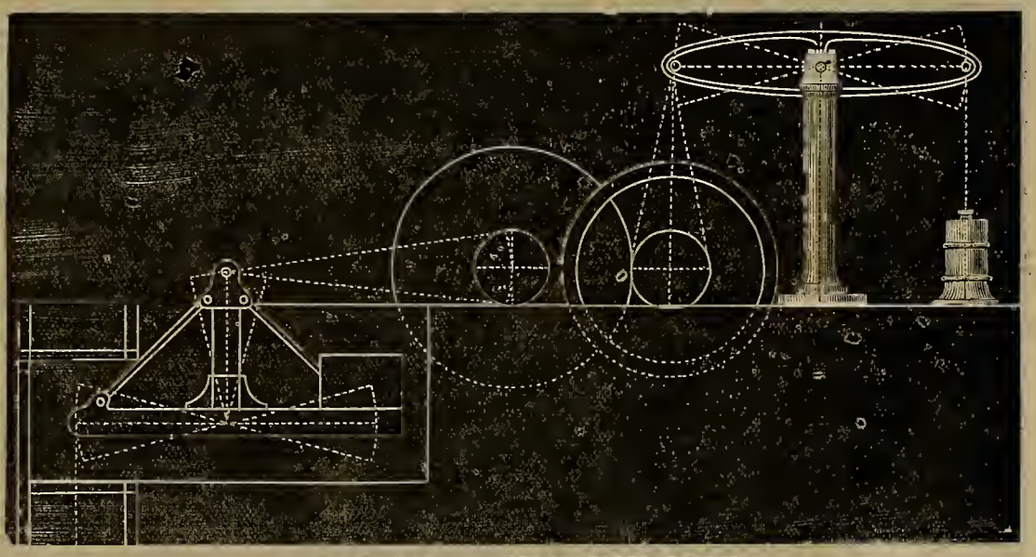

FIG. 12. VERTICAL BEAM GEARED ENGINE.

ond, while we see that to create the same momentum in one case as in the other a velocity of 1.4422 feet per second may be attained.

It is therefore of advantage to make the stroke of the engine greater than that of the pumps, and for the reasons shown above it is never advisable to make the stroke of the pumps greater than that of the engine.

In Upper Silesia the system of direct-acting compound rotary engines has been introduced at several mines and they work with success.

The usage of a fly-wheel is, however, often a practical impossibility, as, for example, in most mines on the Comstock, where the flow of water requires at times a very slow speed of the pumps. With the usage of a fly-wheel, less than two revolutions a minute can hardly be attained. Is, however, the flow constant, they work economically, and their maximal speed can be made greater than that of other direct-acting engines, for whatever part of the momentum is not cancelled by the expansion will be stopped by the crank, while the starting of the mass can be realized quicker by the energy stored in the fly-wheel.

The strain which exists in stopping and starting the mass is naturally injurious, but much less than in geared engines, and it is much easier to construct the parts to resist it.

The valve motion is perfectly sure and the safety on the engine is complete as long as no connection breaks between the beam and fly-wheel.

These engines in Upper Silesia all work with iron pump rods, so as to reduce as much as possible the mass.

When circumstances allow and first cost does not come too much in consideration, they are a class of engines to be strongly recommended.

Generally the pump-stroke is made for these engines one-half the engine stroke.

Before concluding this subject we will examine the system of two rods and two columns of pumps, as compared with the single rod syatem of pit-work. For a double-acting engine the balance required is total weight of the rods and one-half the column of water; with two columns of pumps the rods moving in alternative motion balance themselves, while each pump being one-half the capacity of the water thrown per revolution the engine at each stroke does one-half of its water work and is consequently completely balanced.

Moreover it will be seen that at each stroke the mass moved is the same, being equal to the weight of the rods and one-half the column of water; the mass being the same, an equal momentum will take place, and consequently both strokes can be made in the same length of time. With the single rod system, on the outward stroke the mass is composed of the weight of the rods, the total of the column of water and all the balance weights required, while on the inward stroke the mass moved is the weight of the rods and the balance weights, consequently being smaller by the quantity represented by the whole weight of the column of water, it is clear that an equal speed cannot be attained on both strokes. It will also be remarked that the mass in the double rod is smaller in total than in the single rod system; so that a greater actual speed can be attained under the same circumstances by the engine.

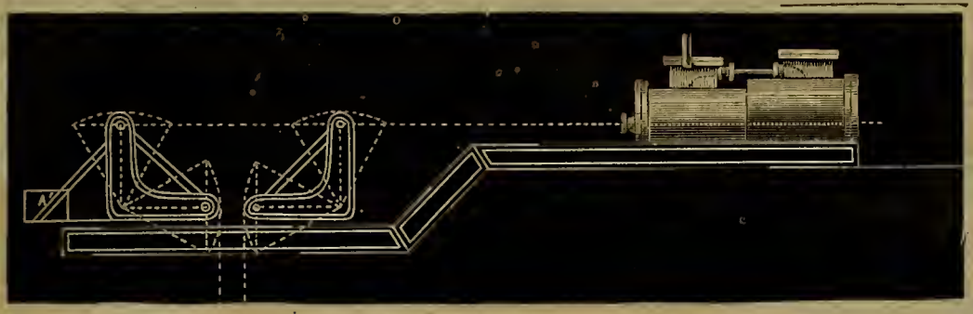

FIG. 16. DAVEY'S DIFFERENTIAL COMPOUND ENGINE.

A is ballast for the Sinking Pump.

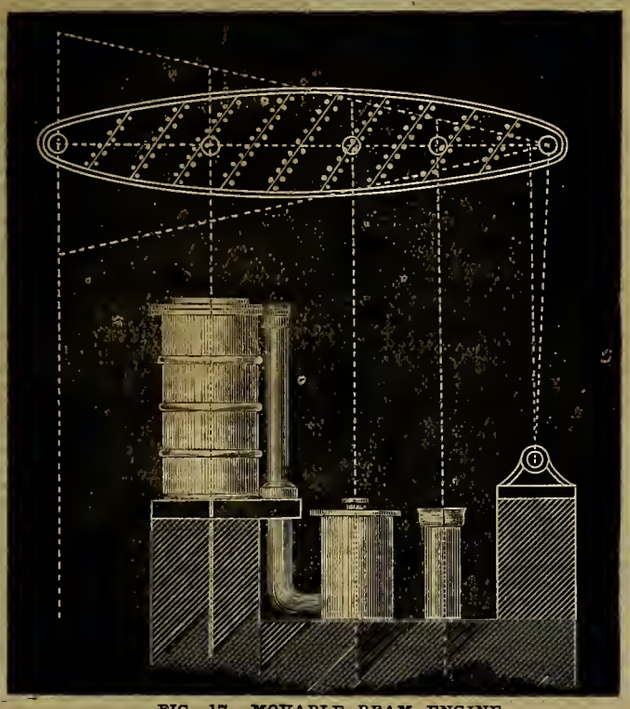

FIG. 17. MOVABLE BEAM ENGINE.

Pumps Longer Stroke than the Engine.

The Alta engine is working on this principle, and it is certainly one to be strongly recommended.

As closing remarks for this chapter, we will recapitulate the defects of surface engine with usual pit-work:

I. The momentum of the pit-work.

II. Moving heavy weights in shaft occasions in many cases caves, when, as in this country, timbering is used.

III. The pumps are required to run all at equal velocity; so that if more water comes at one station than at the others, it cannot be taken up there, without increasing the capacity of the pumps from that station upwards.

IV. The pit-work takes up much room, so that generally a second line of pumps cannot be put in the shaft in case of necessity, and consequently the old ones have to be replaced by a completely new set.

V. If greater depth is attained than that for which the engine is calculated, or more water has to be raised than expected, complete new machinery is in most cases necessary.

VI. Having to take in consideration by the planning of new machinery, the two last named defects, the engines have to be constructed larger than actually required to do the work. The three first named objections are too well understood to necessitate any further remarks.

The three last named objections are serious as regards the outlay of money, and it will be found that while on an engine the interest ought not to exceed 10 per cent., and the depreciation an additional 10 per cent. per annum, the figures will reach nearer 20 per cent. in localities where the sinking of shafts is as rapid as on the Comstock, and where the flow of water is so liable to increase at any moment. This large interest on the money invested in pumping machinery renders the raising of water very expensive; we must, therefore, in any new system, try and reduce these costs as well as put aside the mechanical defects.

Book Notices.

Daire's valuable hand book on the "Preparation and Mounting of Microscopic Objects" is proving of such general value to the student of microscopy that a new edition is issued by the publishers, G. P. Putnam's Sons, of New York, and for sale by Payot, Upham & Co., 204 Sansome street, San Francisco. The new edition is edited by John Matthews, a well known English microscopist, and much new matter is introduced. As the book now stands it is the leading authority on its theme and should be on every microscopist's table.

"Building Construction," by R. Scott Burn, one volume of text, and one of plates, forms No. 3 of Putnam's Advance Science Series (Payot, Upham & Co.). This forms a sequel to the elementary volume on the same subjects named in the series of which both volumes form parts. The letter-press descriptive matter is found as full as the plan of the work and the space admits. This is also characteristic of the illustrations. The diagrams on wood alone, independently altogether of the accompanying volume of plates, are numerous to an extent seldom seen in works of this class. From this point of view, indeed, it may be said to stand alone in this class of literature, which is mainly addressed to students of the practical arts, or to those students who, without intending to carry out practically any of its departments, may have a desire to become acquainted with the subjects in general. A full index is added, so that as a means of reference in a compact scale the books are very convenient.

Silver.

Dr. Lindermann's Views on It.

A *Chronicle* reporter has interviewed Dr. Liudermann, Director of Mints, on the subject of silver. We republish the interview, as it is of valne to oor mining readers:

"I see you ara very much excited ahout tha silver matter," remarked ths Doctor, af er ths usnal preliminsry compliments. "Well, you are a very excitable people. S ill I can hardly blame yon for it, for it is a question of grsat interest hers. Silver is snffering from its demonetization hy ths German empire, ths limitations placed by the Statss of ths Lalin Union on ths coinags of silvsr monsy, and tha exaggsrated reports of ths probahle product of tbs American mines. Ths prics fell in July last lower, as oompared with gold, than it has ever hefors fallen within

The Period of Aulhentic History.

It went so low thet it took only one ounce of purs gold to purchasa twsnty and one-fifth ouncsa of pure si ver. Since that time it has recovered very considerably in price, the rate heing at present 56 pence per ounce, Britiah standard, which corrs-pouds with ons doller ten and a half csnts per ounca, or makes a dollar in subsidiary coin of gold value nearly 89 cents. Ths principal psrt of this advance has taken place during the laet 60 or 90 days. This advance is paitly due to the action of the Uuited Stat s government, which, in view of ths possibilities of war in the E.st, and the financial disturhances which would he likely to result therefrom, deemed it important to provids a reasonahle stock for its coinage oprations. The purchases mads during ths month of October in London amounted to about $2,000,000, ths purchasing rats heing 54 pence, and ths purchass of nearly $1,000,000 was mads at ths same time in San Francisco and New York. Ths totsl purchases since ths beginning of October have amountsd to ahout $5,000,000. The highest rate paid was about 54 psnce, and part of it below tbat rats. The goverinment is not now purchasing, its wauls having heen fully supplied. Another cause of the advance ie the demaud in China.

The Future of Ihe Silver Market

Depends, for one thing, on the action of the German government—that is, what Germany will do with the balance of her surplus silver. Germany hae a surplus snbsidiary coinage on the same principle as that of tbe United States and Eoglaud, the issue of whioh by existing law is not to exceed $2.50 per capita, or ahout 10 marks. A proclamation has recently heen made hy the Germau parliament to increase the issoe to 15 marks per capita, it heing thought that the first limit fixed would not afford a sufficient amoont of change money in that empire There is no purpose to restore the douhle standard in Germany; in fact, the measure to provide for an additional issue of subsidiary coinage points in quite a different direction, this coinage heing subordinate to the gold money, which is the monay of unlim ted ten der. The next reason to be cousid-red is the probable action of France and Belgium as to the coinage of ths year 1877. If the exieting restriction of the coinage in France to the full legal te der silver money—that ie, the five-franc piece—should he removed, there would hs a large market for silver coinage. If, on the contrary, the restriction should he continued for another year, as has heen proposed, or it the coinage of five-franc pieces shonld be intermiited eatirely, the price of silver would he lower. The futore legislation of the United States will elso heve an important heering on this question. Existing laws authorize a total issue of $50,000,000 of subsidiary coin. Should an additional iesue he authorized or a douhle standard be adopted, the effect would be to enhance the value of silver. The demand in India has greatly helped tbe advance."

Why Purchases Were Made Abroad.

"Wny did the Government go abroad to purchase silver? Could it not get enough on this coast?

"The Government, while preferring to deal witb our own citizens and its own prodncers, feels hound hy the law of purchase to huy where it can buy cueapest."

"Were the hnanza men asking too much for their prodnct?"

"That is a point I do not care to touch upon."

"What did you pey for these sheres?"

"Never more than the market rate. We have heen accustomed to regard Loodon as the arbiter of the prioe of silver until within the last tbree monihs, when the demand of coined silvar for the China trade, together with the existence of two mints on tbis coast and the government executing a part of the coinage for circulation in the East here, resulted in placing San Francisco on an equality with the London market. In determining what ie tha market rete of silver we are now obliged to look to the supply in both these cities. In all the purchases made by the United Statas of the bonanza mioe I consider tbat the purohaeer has made a fair average purohase and the seller a fair average sele. The arrangement between Flood & O'Brien and the Government in regard to the purchese of hullion is simply a verbal agreement, I believe. Thera is now about $1,000,000 worth of bullion at the mint waiting to be converted into trade dollars. The Government will need hereafter about $1,500,000 in silver monthly, and it is probabla that no more purchasas will be made abroad. From $12,000,000 to $15,000,000 is likely to suffice for tha silver demands of China. It the market continues as good in China as for the last four months thers is no donht that much Mexicsn bullion will come to San Francisco and be shippsd hence to Chinese ports."

India's Need of Silver.

"Estimating ronghly, how much silver would you say that India is likely to consume?"

"I would say $35,000,000 yearly, or about half the annnal silver product nf the world. That goes from London."

"Is it your opinion that there will hs a heavy demand from Europe ths coming year?"

"That depends on ths possihilities I have already mentioned. I do not think the demand from Europe is likely to hs heevy. Russia, Austria, Spain and Italy have all a forced paper hasis, and that takes off a good deal."

"Would a war with Turkey increaea the demand for silvsr in Russia?"

"No; it would rather dimioish it."

"Will Germany rstain all hsr silver?"

"She will, on the contrary, have to get rid of thoss legal tender silver coins. Shs will sell the silver which ehs hss in that form in moderats quantitiee, and in a way to secure the hest possihls prics for it."

Probable Price.

"What do you think will prohahly he tha price of silver the coming fiscal year?"

"I do not think thers is likely to bs much change in it. I see no particnlar reason why it should go much higher or fall mnch lower."

"I helieve yon do not favor the douhle standard?"

"I do not think it would be a good thing for this country. I think wa shonld keep the gold hasis, with subsidiary silvsr for common nse, fixing ths amoont for legal tender at $10. That is what I recommend in my report. We bavs now, as I setimate, in this country $150,000,000 in gold and lees thon $40,000,000 in silvsr, exclusive of plate. Of this amount, tbere ie from $25,000,000 to $30,000 000 in snbsidiary coin, and from $6,000,000 to $8,000 000 at the mints. To reise the price of silver as compared with gold above its value in other coontries, would he to flood us with tbe poorer metal and drain the land of the more precious."

Comstock Bonanzas.

In common with all other mineral lodes a portion of tha vein material of the Comstock is poor and a portion rich. When the ore is found concentrated in a large and connected body, this body is called a "bonacza." The word is similar in meaning to the terms "pocket," "shuts," "chimney," "ore body," etc. Because of the great size of these Comstook ore bodies, as compared with any other known ones in the West, the Spenish term wae used as sometbing grander, precisely as "canyon" is used to speak of a deep and narrow gulch.

It is these honanzas, saye the *Mining Review*, that have been the source of both the riches and the reputation of ths Comstock. If the vein were laid down flat and their area measured, it would he found that they measured abont one-fourth of the superficial area of the lode. Measored cubically, they compare with the solid contents of the vein as about one to twenty-five. The general form has been somewhat egg-shaped, thoogh presenting quite irregular boundaries, and their dip has been generally to the south. There appears, however, but little regularity in their formation. It must not be supposed that outside of these great ore hodies the vein is barren. Connecting them, and running through other parts of the vein, are often found smaller veins of good quartz, hut owing to the gigantic scale upon which mining ie carried on at Washoe few of these narrow streaks can be worked to any profit. They are good encouragere, however, and often pay nearly for their own extraction. But the many miles of drifts and shafts in the great vein that have heen driven through harren groond for prospecting, ventilation, and other purposes, are evidences of the cost and labor required to find the pay, while at the same time its enormous production, as compared with the total cost, proves that tha investment has on the whole heen exceedingly profitable.

The following liet of the hocanzas of ths Oomstock will be interesting to all who are watching the marvelous history of that mammoth vein:

1 Ophir and Mexican—Discovered on tha surface, and extended 500 feet in depth. Averaga width of ore, 15 feet; cnbical contents, 112,000 toos; approximate value of ora, $22,000,000.

2. Gould & Curry—Extanded from the surface to the depth of 500 feet. Average width of ore, 15 feet; length along tha vein, 500 feet; cubical contents, 190,000 tons; valua of ore, $37,500,000.

3. Savage—This was a continnation of the Curry bonanza, but not so rioh. The ore continned down in the Savage claim to the very bottom of that mine, which ie now 2,300 feet helow the ontcroppings.

4. Hale & Norcross honanza—This body was strnck at a dapth of 450 feet. It averaged 10 feet in width, was about 200 feet long, and stretched down to tha 1200-foot level. Cubical contents, 75,000 tons; value, $5,500,000.

5. Ohollar-Potosi bonanza—struck at a depth of 500 feet; width of the vein worked, 100 feet; has extended with but faw interruptione down to tha present bottom of the mine, which is over 1,700 feet. Cubical contents, 1,500,000 tons; value, $24 000,000.

6 Gold Hill honanza—This body extended from the enrface to a depth of 500 feet, and for 300 feat on ths vein. Contents, 300,000 tons; value, $10,000,000.

7. Yellow Jacket honanza—Discovered on the enrface and extended downward for over 700 feat. The ors on thie body was quite poor, and never yisided much profit. Ite total prodnction was ebout $5,000,000.

8. Kentnck bonanza—300 feet long, 20 feet wide, and 400 teet deep. This ors was very rich. Contente, 100,000 tone; value, $10,000,000.

9. Orown Point and Belcher honanza—Discovsred on the 1400-foot level and extended downward for 600 fset. Is still prodncing in ths Belcher. Contents, 1,500,000 tons; value, $50,000,000.

10. Coneolidsted Virginia and California honauza—This last and greatest ore body which the lods bas yet developed, was found hy drifting eastward from ths 1500-foot lsvel into what wae supposed to hs the last country rock. The honauza liee abova and bslow this, and is helieved to contain $140,000 000. It extends for ahout 700 fsst along the vein, is 600 feet in hight and nearly 100 feet in width. Up to the present date it has yisided over $30,000,000, thongh discovered lees than two years ego, and ia now producing at ths rate of $120,000 per day.

Ths Comstock now fornishes employment for over 2,000 miners. Its daily output of ors is nearly 2,000 tons, and its yield tbie year will approach $50,000,000. One-balf of this (or, mors correctly, about 42 per cent.) is gold, and the halance silver. When tha amount of ors now in sight ie taksu out, the lode will have prodoced in all eomething over $300,000,000 in precious metals.

Pacific Coast Appropriations.

Detailed estimates of the appropriations reqoired for all branches of the publio servics for the next fiscal year have now heen furnished by the Secretary of the Treasury to Congress. The following ara the appropriations recommended specifically for the Pacific States and Territories:

To complete the Appraiser's huilding, San Francisco, $100,000.

For the completion of the San Francisco snbtreasury, $20,000.

San Francisco Mint—Salaries, $24 900; wages of workmen and adjustsre, $800,000; contingent expensee, $100,000.

Carson Mint—Salaries, $24,300; wages, $100,000; contingent expenses, $50,000.

For collecting mining-statistics of tha United States, $5,000.

For salaries of the San Francisco snb-treasury, $24,370.

Tbe appropriations granted for the San Francisco mint at the last session were $50,000 less than the smoont now asked. The estimates for Carson ars $35,000 more thau tbe last appropria ion.

Mare Island Navy Yard—For the continnation of the stone dry dock, $650,000; quay wall and wharves, $100,000; other improvements, $150,000.

Only $50,000 wera appropriated for Mare Island improvements last session.

Benicia Arsenal—Varione repairs and improvements, $135,000.

Fort fications—Fort Point, $60,000; Alcatraz, $50,000; Mouth of Columhia river, $20,000.

River and Harhor Improvements—Oakland harhor, $250,000; Wilmington breakwater, $100,000; Sacramento and Feether rivers, $20,000; Lower Willamette and Colnmhia, from Portland to sea, $15,000; Upper Willamette, $45,000; Upper Columbia and Snake rivers, $30 000; Canal at Columhia River cascades, $300,000; to establish a dry heacon on Anita rock, San Francisco harhor, $23,000. (An accompanying note nrges this estimate, with the remark that this rock is a serious obstrnction, and should he removed); to build light stations on Point Concepoion, Farallone islands, each $9,000.

For Surveying Public Lands—In California, $50,000; Arizona, $25,000; Oregon, Washington, Nevada and Utah, each $15,000.

For surveying Private Land Claims—In California, $10,000, Arizona, $3,000; New Mexico, $1,500.

Clerks and Contingent Expenees—Surveyor General's officers, California, for clerk hira, $20,000; incidentals, $7,000. These amounts are urgently recommended to enahla the California Surveyor General to copa snccessfully with the diversified offica work called for hy numerons Acts of Congress; they aggregate $8,000 more than the amounts granted last session. Nevada—clarks, $8,300; incidentals, $4,000. Oregon—clerks, $7,200; incidentals, $2,500. Washington—clerke, $7,200; incidentals, $2 000. Utah—clerks, $7,600; incidentals, $2,500. Theee estimates all largely exceed the amounts of the last appropriation, bnt are recommended as absolutely necessary to bring up arrears of work.

Tha estimatee for the salaries of all Federal officials in the Pacific Statas and Territories are as ara usual, for tha precise amonnts heretofore pra-cribed by law.

The estimates furnished for the general expenses of tha Indian servioes are: For California, $60,000; Navada, $35,000; Oregon, $40,000; Washington, $20,000; Utah, $20,000; New Mexico, $40,000; Arizona, $65,000. Tna amounts appropriated for the current fiscal year were only $30,000 for California, $20,000 for Arizona, $15,000 for Oregon and New Mexico, $10,000 for Utah, and $5,000 sach for Nevada and Washington.

Ths appropriations are also recommended of $25,000 for the civilization and subsistenca of the Indians of ths Malheur reservation, Oregon, $45 000 for collecting and sustaining ths Apaches of Arizona and New Mexico. Tha emount appropriated for thsse Apaobss last seseion was $125,000.

Kern County Mines.

From a recent number of ths *Courier-Californian* we taks the following concerning the mines of Kern county:

Gold was discovered as early as 1853 in the tributaries of Kern river, many of which contained rich placere. Those were soon worked out, and attention was then directad to quartz mining, and many valuable leads have heen fonnd and worked with greet profit for many years. The whole mountain rangs ribhing tha county on the east and south, is rich in mineral. The lack of speedy and adequate means of communication, bowever, previons to the advent of ths railroad, which has just hsen completed through ths county, rstarded ths development. But a nsw impetus has been given to the mining interest hy the railroad, and many entsrprises of that chsracter ara now in course of prosecution, that had been abandoned when wages wers high and freight fiva cents per pound. There are probably 5,000 persons now in tha mountains, engaged in mining and kindred pursuits.

Havilah, at one time a very prosperous and populous camp, and ths former county seat, but latterly, for ths reasone cited above, about abandoned, is reviving with encouraging signs of a healthy and permanent growth. There are now three mills running and making good returns. Tbe mines are in the hands of persons who are satisfied to derive legitimate profits from the working of the mines, rather than feverish and uncertain fluctuations of the stock market. With restored confidence and the existing stimulus, it is reasonable to predict within a short time a return of the old times, when there will be employment for hundreds of men and a demand for business facilitaes of all kinds in proportion.

The Warrington gold and silver mining company, at Havilah, under the superintendence of Mr. R H. Stretch, is operating several mines end running a 10-stamp mill on good ore. The other two 10-stamp mills are running on custom work and making good returns. The mills are kept running night and day. Arrangements ara in band which will result in the operation of several other mines of known value. There ara at present something over 50 persons employed in these mines.

Kernville is now, and has been for a number of years, one of the most flouriehing mining towns in the State. The Sumner mine is the principal, in fact the only mine that sustains this populous settlement. It is owned by Senator John P. Jones, the honanza millionaire, and E. R. Burke, and ie under the direct management of the latter. The lead was discovered in 1860, hut was never properly worked till it fell into the hands of the present owners. Many other locations were made originally, but these have been bought up from time to time till the Sumner mining company now owns the entira lead for some four miles—as far as it can be traced, and has a United States patent tor it. It will be seen then that the supply of ore is practically inexhanstihle; at least, for this generation, even though worked on the extensive scala and with the effective force now employed. The mine is situated about a mile from Kernville, on the North fork. The mill is run by water power, of which there is ecoogh to run all the mills of Nevada. The ore ie conducted in cars that run themselves on an inclined plane from the dump of the mine to the mill. Although a great deal of work has been done and a vast quan ity of ora extracted, comparatively little impression has as yet been made on the great lead. The greatest vertical depth attained is lese than 200 feet. The lead varies in width from 10 to 45 feet. Some of it is nearly barren, but, again, thera are chimneys of extraordinary richness. A large sum of money has been expended in placing this mina in good condition, and large sums have been extracted from it. It is but about a year since tha new 80 stamp mill has been completed and in operation. This mill is said to he tha finast piece of work of tha kind in tha State. It is supplied with all tha latest improvements for the reduction of ore. Everything is done in the most complete manner hy machinery, scarcely requiring the oversight or superintendence of man. To so perfect and well menaged a system has tne working of this mine been reduced, that the cost of extraction and reduction bae been brought to the merely nominal snm of between four and fiva dollars per ton. About a hnndred tons of ore are now being excavated and crushed every 24 hours, the mill running night and day, and the men working in three shifts of aight hours each. A large number of Cornish miners, the most skilled in the world, ara employed here, and the entire force, including lumbermen, millmen, and others connected with the mina, does not fall far short of 200.

DEWEY & CO.

American & Foreign Patent Agents

OFFICE, 224 SANSOME STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditionsly; Patent reissues taken ont; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington: Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.,

United States and Foreign Patent Agents, publishers Mining and Scientific Press and the Pacific Rural Press, 224 Sansome St., S. F.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,
MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price $2.50 coin, or $3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy,

Containing 672 Pages and 83 Engravings

BY J. S. PHILLIPS, M. E.,

Of California, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Eight Years.

PRICE, bound in cloth, $10.50; in leather, $12. Forwarded by mail for 50c. extra, at the MINING AND SCIENTIFIC PRESS Office, by

PAUL'S DRY PROCESS.

I am now prepared to test gold and silver milling ores in any quantity from TEN POUNDS to FIFTY TONS, and assert my ability to prove, by machinery NOW UP, and open to public inspection, and by practical testing of its merits, that I can increase the yield of gold mills, working wet batteries and copper plates, from FIFTY to ONE HUNDRED PER CENT., and on silver ores a much larger percentage than by pan amalgamation, and at less expense than any known method of working quartz well; and from some "gold" ores of California can extract more silver extra with the gold, which is now lost, than all the expenses of mining and milling. Having had 25 years' practical experience in milling gold and silver ores, I presume to know whereof I speak, and AM PREPARED TO PROVE ALL I ASSERT. These mills, for simplicity, cheapness practicability and perfection in working, challenge the skill of the age to surpass. Quartz miners who desire to investigate and have their ore tested, are invited to a critical examination of the machinery and process, and can receive permits for examination, particulars and pamphlets explaining process by calling at my office. Continued from Page 413.

when completed it will he the finest hnilt mill in the State, and that no expense has been spared in making it most complete in every particnlar. The plans and constrnction of the mill have been under the immediate superintendence of mining engineer O. B. Dahlgren, which should be a sufficient guarantee for its being built in a proper manner. In amalgamating, no pens are to be used, but the new system of "leaching" is to be inaugurated, which is highly spoken nf hy those who are familiar with the process. Should the season prove to he an open one, it is thought the company will he able to keep their fnrnaces and mill constantly rnnning the whole winter. There are a number of new hnildings in c nrse of erection in tbe tnwn, and many more would he built if lumber could he obtained.

PALMYRA DISTRICT.

Specimens.—Virginia *Enterprise*, Dec. 16: John Stuart, who has recently been in here from the Palmyra mining district, which lies in Lyon county, and 15 miles from Dayton, has left on our table some beautiful specimens of ore. One piece, weighing psrhaps 20 pounds, came from the Aurora ledge, and only 40 feet below the surface. It is excellent ore, containing gold in abundance and silver in both sulphurets and chlorides, principally, however, in the former. The ore is weather-stained to the appearance of float-rock, but has been lying on the dump all these long years, since work was active in the Palmyra district. Mr. Stuart also showed assays made in this city, of float-rock of the Anrora. The result obtained was a little over $1,000. Of this amount all except a very few dollars was in gold. Mr. Stuart says there is plenty of ore there, and that the sample shown is hut a fair—not a picked—specimen. We gave, a few days since, an account of the relocation of several claims in the district. The affair is creating quite a stir here on the Comstock, and capitalists are beginning to inquire whether there is not something in it.

CENTRAL DISTRICT.

Bonded.—Eureka *Sentinel*, Dec. 16: We understand that General Rosecrans has bonded for 60 days some two or three promising but undeveloped mines in Central district, in Hnmholdt county. We hope the gallant old soldier will succeed in organizing a company to develop them.

RAILROAD DISTRICT.

Trouble.—Elko *Independent*, Dec. 16: There seems to be some tronhle at Railroad district hetween the miners in that camp and the company, which recently commenced nperations thero nnder very favorable auspices. Several of the miners who have been employed in the district arrived here yesterday, and report the mines as looking first-rate, but we are led to infer from some remarks dropped yesterday that they are displeased with the conrse of the company throngh which the business of the camp has lately been revived.

GROOM DISTRICT.

Relocated. — Pioche *Record*, Dec. 10: From Mr. Black, who arrived from Groom district on Sunday last, we learn that work will be commenced very shortly in that district. The Armagosa mine, situated about 16 miles from Resting Springs district, and formerly owned by San Francisco men, has been relocated by some parties from Groom and Resting Springs. This mine at one time produced ao immense amount nf hullion.

Meetings and Elections.

Stepton Cons. M. Co.—Dec. 11th. Myron Angel was elected a director in place of J. H. H. Williams, now absent in New York. The Board now consists of the following officers: J. D. Wheeler (President), S. N. Putnam, George Laws, Robert Briggs and Myron Angel (Secretary).

Emigrant M. Co.—Messrs. Shawhan and Falk have resigned from the directory, and Messrs. H. C. Swain and John Hohart have been elected to fill the vacancies.

De Frees M. & M. Co.—Dec. 15th. Trustees—M. P. Freeman, T. E. Atkinson, C. W. Elliott, C. E. Convis, W. B. Newholt.

Gould & Curry M. Co.—Dec. 18th. The Secretary's report embraced the following details: Receipts—Cash balance November 30th, $11,022.59; five assessments, $390,553.15; mine account, $32,251.21; superintendent's house, $250; F. F. Ashton, $28,412.2; balance, $62,191.24; total, $542,679.43. Disbursements—Mine account, $508,503.79; general expenses, $33,583.04; total, $542,679.43. The report of the superintendent was read and accepted. The balloting for officers resulted in the re-election of the old ticket, as follows: President, Chas. H. Fish; Vice-President, George Congdon, Secretary, A. K. Dnrbrow; Superintendent, James G. Fair; Trustees—Wm. S. Lyle, J. C. Flood, R. H. Follis and Robert Sherwood.

Andes S. M. Co.—Dec. 18th. Trustees—Geo. S. Dodge, R. G. Brown, R. F. Bunker, John Landers and G. W. Britton. Subsequently George S. Dodge was chosen President, M. Landers Secretary, and John F. Egan Superintendent. Report from Supt. Egan was read and approved. Report was accompanied by photographic views of the machinery and hoisting works, also undergronod plan of the workings of the mine during the past year. The Secretary's report shows receipts dnring the year $75,000, heing amount collected on assessments Nos. 6 and 7. Disbursements, $56,619.70. Balace cash on haod, $18 580.30.

The Opbir annual meeiiog was held on Wednesday. The Secretary's report contained the following details: Receipts—Cash on hand December 15th, $21,254; from bullion, $2,340,848; sundry sources, $41,999. Disbursements—General expenses at the mine, $16,815; Buck's shaft construction, $773 374; machinery for same, $258 121; Ophir mine, $41 945; office expenses in San Francisco, $10,294; Buck's shaft building, $49 672; discount on bullion, $228,032; milling, $812,840; cash on band, $379,600; incidentals, $24,468. There is also $13,000 cash in the hands of the superintendent. The election of officers for the ensuing year was then in nrder, and hy a unanimous vote of the stock present the following gentlemen were appointed trustees: C. L. Weller, J. D. Fry, A. K. P. Harmon, J. H. Dohinson, Joseph Sharon, A. P. Wade, J. P. Jackson. The superintendent, Samuel T. Curtis, stated in his report that during the last year 68,011 tons of ore have been extracted from the mine, of which 67,736 tons were worked, yielding bullion smounting to $2,340,848.70. After the meeting adjonrned the trustees met and elected the following officers: President, C. L. Weller; Vice-President, J. D. Fry; Secretary, W. L. McCoy; Superintendent, S. T. Curtis.

New Incorporations.

Tha following companies have filed certificates of incorporation in the County Clerk's office at San Francisco:

Ontario S. M. Co.—Dec. 15th. Capital stock, $10,000,000. Trustees—J. B. Haggin, A. E. Davis, W. B. Carr, J. C. Ball, B. B. Minor, C. R. Greathouse and Wm. Willis.

Panamint Valley Water Co.—Dec. 17th. Directors—R. C. Jacobs, J. W. Pearson, D. M. Seaton, P. I. McLaren and C. E. Pearson. Capital stock, $5,000,000.

Midas M. Co.—Dec. 18th. Location: Arizona. Capital stock, $4,000,000. Trustees—John T. Porter, A. D. Scott, Thomas B. Bishop, W. H. Fifield and W. H. Whittaker.

Cardinal Constantine Patrizi, Dean of the Sacred College, is dead.

Comstock Papers.

No. 13.

The Central, Kinney and Sides.

The Central ground was so denominated from its position hetween the Ophir and the California mines, then considered the most important, and in fact, about the only two claims, except the Mexican, worth much on the great lode. The Kinney ground, though not located by, was pnrchased at an early day by the man whose name it bears. After holding it for a long time, during which very little work was done npon it, he finally disposed of it to James C. Flood, for the sum of $1,200. Recently, Kinney has brought suit to recover a portion of this ground, which he alleges was deeded away by him under a misapprehension as to the nnmber of feet he was actually conveying to the purchaser. This fraction of his claim now incorporated in the Consolidated Virginia mine, is worth in the stock market nearly a million dollars. Richard Sides, his brother William and some of their neighbors, mensged, like many of the primitive settlers in Washoe, to possess himself of a section of the great mother lode on terms that involved the payment of very little money. This section, formerly known as the Dick Sides claim, covers five hnndred linear feet, lying hetween the White & Murphy on the north, and the Best & Belcher on the south. It had not been much developed up to the time of its purchase by the owners of the Consolideted Virginia mine, of which it et present forms a part. Sides and his partners disposed of their interests in it many years ago, receiving what was then deemed a fair equivalent for the property. This men, who was living on Cleer creek, Carson valley, before the discovery of the silver mines, still continues to he a resident of Washoe. In 1859, his brother William killed a man named Jessup, at the town of Gold Hill, for which offence he was obliged to flee the country, the circumstances under which the act was committed being too atrocious for even a Washoe community to overlook. Jessup was buried close beside the wagon road at the lower end of the town, his being the first grave in the place. After a year or two his remains had to he taken up, the wagon road having been so changed thet it ran directly over the little mound under which they rested. Jessup was held in good repute, and his death was much deplored by those who knew him. He owned fifty feet in the Ophir at the time he was killed, from the sale of which his mother, who came ont from Missouri soon after, realized a handsome sum.

Abernethy and Baldwin, who also lived on Clear creek, where they carried on ranching and lumbering, owned hetween them 150 feet in the Sides ground. Taking the money received from the sale of this property, and some feet they owned in the Belcher, they came over to California and bought land in Suisun valley, where they have since lived in independent circumstances.

Concerning the Locators of the Best & Belcher

We have not much knowledge. Best seems to have retired from the active scenes of Washoe life at an early period. Belcher, who had been a ranchman in California and went to Washoe in 1859, also disposed of his interest betimes, both in this claim and in some others at Gold Hill, which he had obtained from Comstock. Soon after he returned to this State and betook himself to his former occupation, which he has since successfully pursued. He was a quiet, gentlemanly sort of man, of more than ordinery intelligence and good business hebits.

The Gould & Curry Claim

Passed into the hands of these two men and their associates early in the summer of 1859, having been sold to them hy the original locators. The purchasers themselves sold ont the same fall to other parties, and at low figures, Curry having received not over six or seven thousand dollars, and Gould still less for his interest. They were both men of superior character and first rate business capacities. Abram Curry, or as he was more commonly called, Colonel Curry, had been in early life a steamboat man on the Western lakes and rivers, and was marked hy something of that off-hand, rough energy and frankness characteristic of men trained in that school. He was, nevertheless, a kind-hearted, honest man, and distinguished for his public spirit and enterprise. He was among the first settlers at Carson City, and did more than any other man to build up and improve that place. As early as 1860, he took up the Hot Springs, two miles east of the town and put them in fit condition for public use. At this point he also opened extensive stone quarries, from which he afterwards took ont materiel for the construction of a court house and other public buildings, at Carson, and still later for the Capitol of the State, and the United States mint, all of which were put up under his supervision. He also held the position of Superintendent of the Mint at that place, the duties of which he discharged in a manner to secure the approval of both the Government and the people. He died at Carson City some four or five years since, leaving his family not exactly poor, yet far from being rich. His partner Gould went to Reese river in 1862, and there engaged in the lumber manufacture and trade, which he carried on successfully for a number of years. Later, he was at several of the other pioneer mining camps in central and eastern Nevada, engaged in the same line of business. He is now a resident of California, and it is not too much to say of him that he has always enjoyed the confidence and respect of the several communities in which he has lived and transacted business.

Items of Interest from the Mines.

We give below items of interest from prominent mines, most of which are colleted from letters of the respective superintendents on file at the offices in this city. Considerable of this news is later than that procured from the interior journals:

Ventilation in lower levels of Consolidated Virginia mine is very poor. They have a large force of men enlarging the drift connecting with the 1550-foot level of the Gould & Curry mine, and have already improved the circulation of air, but it will require some 10 days to complete this work. On the 1700-foot level no work has been done the past week, owing to the great heat.

The ore body in the uprsise from the 500-foot level of the Leopard is 18 inches thick and the ore of good quality.

But little progress has been made the past week in lowering the water in the Hale & Norcross mine.

The last letter from the Superintendent of the Manhatten says: The average of ores worked during the past week is $157.59 per ton. The average of the past 24 hours is $197.92. The grade is steadily gaining. 500-foot stope, Frost shaft, shows some improvement on east side and upper part. The 500 east drift continues in a large ledge of good ore. The 500 west drift carries a large solid ledge. Stope above this drift is still being opened ont, and shows good ore throughout the vein. The winze sinking from the 500 east drift is down 40 feet and shows a splendid large ledge of very high grade ore. This winze is proving what we have always thought—that the best part of this chimney is still below us, and will be reached through the 571 cross-cut, which is within 100 feet of the ledge.

The Superintendent of the Julia expects rich developments, at no distant day, in the cross-cut from main south drift.

The work of retimbering the sheft and incline of the Gould & Curry is being pushed repidly ahead.

There is still considerable prospecting being done throughout the old abandoned levels of the Mesdow Valley mine, by chloriders, but so far the ore disclosed is of low grade and limited in extent.

Good looking quartz bringing as high as $41 per ton has been encountered in the Leviethan mine.

Letter of the 17th from the Justice says: shipped 339 tons of ore to-dey to ten different mills of the company. Mine continues to look well throughout. Machinery in fine order. North drift is being vigorously pushed ahead, to effect a connection with No. 2 crosscut. A fine ore body is now making its appearance from west side. At the point where this winze was commenced the vein is 17 feet in width. The winze is sunk on the east portion of the vein. Upraises continue to develop a regular body of high grade ore. Other portions of the mine are looking very well.

The cross-cut on the 1700-foot level of the Best & Belcher is being pushed ahead as fast as the intense heat will permit. A diamond drill is to be put at work on that level. This mode of cross-cutting can be done in most any kind of heat and where work cannot be done with picks and drills. On the 1500-foot level the main drift is being enlarged for the purpose of ventiletion.

In the Raymond & Ely a cross-cut was run south from west drift on the seventh level a distance of 20 feet, at a point 290 feet west of main shaft, which discloses a small streak of good ore lying to the west of the Hermes cross-cut, which they are now engaged in following, but there has been considerable stoping done in the immediate vicinity of this crosshead. This streak may run into some of the old workings and prove to be limited in extent.

Letter of 16th from Eureka (Grass Valley) says: Our clean-up for the last six days was 240 ounces of amalgam. Have driven No. 3 cross-cut nine feet; ground very hard.

The accounts of the famine received from Madras are worse than those from Bombay. Large numbers of starving people are flocking into Madras to escape death from starvation. There is much distress existing in the country districts.

The Colorado steam navigation company's steamer *Montana* was burned in the Gulf of California on December 14th. The passengers and crew were saved, but the ship and cargo are a total loss.

The poultry ring is reported as now pretty thoroughly broken up by the action of the two large firms who are selling to the best bidder whoever he may be.

Four hundred employees in the bureau of printing and engraving at Washington were discharged Saturday, about two-thirds being women.

The Charter Oak life insurance company of Hertford has purchased $3,000,000 of real estate on Broadway, Wall and Broad streets, New York.

Patents & Inventions.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports for the Mining and Scientific Press, Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

For Week Ending December 12th.

Traveling Satchels.—Elizabeth W. T. Keeney, S. F.

Apparatus for Hydraulic Mining.—Geo. W. Cranston, S. F.

Farm Fences.—Charles Cremer, Red Bluff, Cal.

Machines for Stitching Mattresses.—David Harris, S. F.

Machines for Stuffing Mattresses.—David Harris, S. F.

Section Jointed Nozzles for Hydraulic Machines.—Richard Hoskin, Dutch Flat, Cal.

Feed Racks for Horses.—Joseph Oscar Johnson, Salinas City, Cal.

Oil Can and Faucets.—Alfred H. Marshall and Geo. W. Marshall, Lower Lake, Cal.

Threshing Machines.—Gen. R. H. Miller, Oregon City, Oregon.

Setters.—Hiland A. Moore, S. F.

Oil Cops.—Wm. T. Garratt, S. F.

Manufacture of Solder Wire.—Hilsnd G. Hubbard Placerville, Cal.

Safety Guard or Cock-eyes for Harness.—Fayette, W. Kuapp and Christopher Schalbhorn, Fiddletown, Cal.

Notices of Recent Patents.

Among the petents recently obtained through Dewey & Co.'s Scientific Press Amsrican and Foreign Patent Agency, the following are worthy of mention:

Seat.—H. A. Moore, San Francisco. This invention relates to a novel constrnction for long portable seats or settees, snch as are intended to accommodate a nnmber of persons, and are nsed for pnblic hells. It consists in a novel method of constrncting the frame, legs and seat of the settee, by which ths inventor is enshled to obtsin the most comfortehle shape for the seet and back, with increased strength, lightness, portebility and economy of constrnction, while the meterial, after bsing got ont in proper shepe, may be compactly packed and shipped to any point where comparatively nnskilled lehor will be needed to pnt the parts togsther, and build the settees. In the ordinary method of constrnoting settees, the seat is formed of a plank, thick enongh to allow the nppsr snrface to he worked ont into a slight cnrve, and the turned legs are driven into this plank sest, while an inclined bnt strsight back is formed of ronnds driven into the resr npper snrface of the ssat. This form of settee is heevy, nncomfortable and sxpensive. This settee is compos.d of end pieces which are sawn ont of one-half inch plank, and one or more middle sections of the same shape, these sections being nnited by nerrow longitudinal strips to form the seat. By the pecnliar constrnction patented, the inventor is ensbled to givs his settse the best form for comfort, to constrnct it cheaply of wood in snch a manner as to render it light and easily portable, and the psrts can be closely pecked and shipped to their destinetion before being pnt together, thns saving freight. They are strong and symmetricel, and do not become loose-jointed or noisy, as when ronnds are driven into holes.

Feen Box.—J. O. Johnson, Salinas City, Monterey Connty. This invention is a pecnliar feed box for horses and other animels, its object being to prevent the animals from wasting the food by throwing it ont of the box. This box is set on the side of a menger, and is constrncted in snch a manner thet the animel cen not throw ont his feed. It is alec arranged so as to prevent annoyance from fowls when they are ahont the stsble, as they will be nnable to fly down, or get at the grain while the animel is eating.

Manufacture of Solder Wire.—H. G. Hulburd, Placerville. This is an improvement in the mannfactnre of solder wire for soldering pnrposes, and it consists in rnnning the melted solder throngh a fnnnel-shaped vessel into water, where it is cooled and converted into wire, snch as is nsed for soldering. The improvement consists also in the construction end arrangement of the receiving vessel, which is arranged to have nozzles of different sizes for diff.rent sized wire.

The *Herald's* London special says: "The Indian authorities, it is said, have telegraphed the home governmsnt, that if England withdraws her snpport from Turkey, the Mnssnlmans of Hindoostan will certainly becoms obstreperons. If this shonld prowe true it will be a sonrce of no small embarrassment to the English government in the negotiations at Constantinople, and it may heve more influence in determining its Eastern policy than all the Bulgarian msetings and party conferences on the Eastern qnestion, that have been held in England dnring the last two months."

It is steted on good anthority that the Khedive is dissatisfied with his American military officers, and has notified them thet contracts will not he renewed. The policy of this step is qnestionable, as a renewal of the Abyssinian war is considered imminent.

Woodward's Gardens embraces an Aquarium, Museum, Art Gallery, Conservatories, Tropical Houses, Menagerie, Seal Ponds and Skating Rink.

A New County Bridge.

We take from the *Russian River Flag* the following data concerning the Alexander valley bridge, just completed:

Length of bridge, including tha 40-foot span across tha slough on the west sida..	1,483 feet
Width in tha clear	16 feet
Material used—redwood	200,000 feet
Material used—pine	85,000 feet
Total in bridge	285,000 feat
Total time an tha work	72 days
Taka ont Sundays	10
Dalayed in dalivery of lumber	11¾ 21¾
Number of days worked	50¾
Total cost without tha 40-foot span	$13,330

Contractors, tha Pacific bridge company; Snperintendent and Engineer, R. W. Gorrill; Assistant Engineer, H. B. Alexander; Foraman, Hoffman.

The structnre is second in magnitnde of its kind in the State, and we donbt that better mechanical and engineering skill or better material has been bestowed on any bridge in the State; and certainly 50¼ days is a remarkably short time to be occnpied in its construction, especially when there was a freshet in the midst of it, carrying away the false work for the 125-foct span.

The Snperintendent, Mr. Gorrill, being very ill at the beginning of the work, it devolved on Engineer Alexander and Foreman Hoffman to continne and finish the bridge. If honor is to whom honor is dne, it is to these gentlemen for the rapid and thorongh performance of their dnties; and to them as well as to the company the Alexander valley people are very gratefnl for not being compelled to risk their lives another winter in getting to and from market as in years past.

Mr. Gorrill, on behalf of the company and his assistants, requests us to retnrn his thanks to onr people for all the acts of kindness tendered himself and assistants while among them, and their favorable expression for the company. He had hoped to join them in a general jollification at the completion of the work, bnt was compelled to forego that pleasnre on acconnt of continued illness.

The bridge company having completed its contract, Road Master Jacobs is filling in the approaches, and by the close of this week will have all in readiness for teams of heavy as well as light draft to cross. The floods of winter and deep and soft sands of snmmer will no longer impede the traffio between Alexander valley and adjacent points and Healdsbnrg.

On Tuesday the Board of Snpervisors accompanied R. W. Gorrill to the bridge, viewed it and retnrned to Sants Rosa on the same day. At a Board meeting yesterday, the bridge was duly accepted according to contract.

A COMPLIMENT.

PLAINSBURG, MERCED CO., CAL., June 22, 1874.

DEWEY & CO.—*Gentlemen:* I herswith tender my gratefnl acknowledgements for the energy, promptness and efficiency which yon have displayed in procuring my patent.

Although yon were entire strangers to me when I first communicated with you, I was never felt satisfied you were gentlemen of integrity, and shall always be happy to represent yon as snch. Very truly yonrs,

H. W. RUCKER, M. D

HAMILTON, NEV., May 26th, 1876.

To Messrs. Dewey & Co., Patent Agents:

GENTLEMEN—I write to acknowledge the receipt by express of the U. S. letters patent on my invention for breech-loading ordnance, and to tender yon again my very sincere thanks for the carefnl attention yon have bestowed npon my application since I first placed it in yonr hands, for the evident great interest yon have manifested in it, and for the uniform patient and cheerful courtesy which has constantly marked your correspondence in reference to it. I have had some dealings with other agencies in the same line in times past, and I can assure you that my correspondence with yonrs has been more pleasant and satisfactory than with any others, and I shall always take great pleasnre in recommending your agency to any and all my acquaintances without hesitation or reservation, as I shonld certainly prefer to entrust my own business in your hands should I have any to transact in the same line hereafter. Yours, etc., J. R. N. OWEN,

ANY PERSON receiving this paper after giving an order to stop it, may know that snch order has failed to reach us, or that the paper is continued inadvertently, and they are earnestly requested to send written notice diract to ns. We aim to stop the paper promptly when it is ordarad discontinned.

ISSUED OCT. 1st, 1876.

Testing and Working Silver Ores.

The above is tha title of an illnstrated work of 114 pages, for miners and prospactors by Chas. H. Aaron, which has just been isenad hy Dewey & Co. Mr. Aaron has managed to giva many nsefnl hints and snggestions, free from all technicalities, and in such a style as to ha easily comprehended. It is written for tha miner, with no chemical symhols or metallnrgical technicalities to confuse those who are not chemists or matellnrgists. The following summery of the contents of the work will give an idea of its scope:

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ora is considered, amelting orss, selecting and working sample, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochlorids of copper, nss of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amelgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of hese metals stirring, heat of furnace, want of snlphnr, etc. Under the head of "Leaching Processes" are the titles, Smelting, Mexican process, Kroencke's process, Chilean process, etc. Under "Pulverizing Meohines" are described the arastra and its constrnction and operation, stamp hatteries, screens, Crocker's trip-hammer hattery, Paul's pulverizing barrel, Kendall's hattery, Nolca's pulverizer, a cheep rock hreaker, etc.

In speaking of smalgamators the author describes a cheep amalgametor, grinding the ore, directions for making a herrel, preventing mechenicel wear, nss of quicksilver, copper in hsrs, Freiherg barrel, cheap her rel, tronph, herrel on rollers, Aaron's amalgemator, separator, etc.

He describes an improved retort, roasting furnace, furnace tools and furnace hnilding. Among the miscellaneous mention may he fonnd Aaron's leaching apparatus, with two or three different arrengements, a small mill, sampling tailings and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

The hook is a serviceahle one for miners' and prospectors' nse. Price, post free, (in leather,) $2.00. Address Dewey & Co., MINING AND SCIENTFIO PRESS, 224 Sansome street, San Francisco.

UNITED STATES

Mineral Land Laws, Revised Statutes,

And Instructions and Forms Under the Same.

We have jnst issned a pamphlet containing the general mineral land laws of the United States, with instructions of the Commissioner of the Land Office The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872, with Instructions by the Commissioner of the Land Office; Mining Statute of Jnly 26th, 1866; Mining Statnte of July 9th, 1870 Forms required nnder Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Survey; Application for Patent; Proof of Posting Notice and Diagram of the Claim; Proof that Plat and Notice remained Posted on Claim during Time of Publication; Begis; ters' Certificate of Posting Notice for Sixty Days; Agreement of Publisher; Proof of Puhlication; Affidavit of $500 Improvements; Statement and Charge of Fees. Proof of Ownership and Possession in Csse of Loss or absence of Mining Records; Affidavit of Citizens hip; Certificate that no Suit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no Known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will he sold, post-free, for 50 cents. It should be in the hands of every one having any mining intereste. DEWEY & CO.,

Publishers of MINING AND SCIENTFIO PRESS, S. F.

Superior Photographs.

To be sure of a good picture, you have only to patronize G. D. Morse's Palace of Art, at No. 417 Montgomery street, S. F. The publishers of this journal have patronized Mr. Morse for many years, and do not hesitate to say that his pictnres are not excelled hy any we heve seen produced in this or any other country. No one can ask for a hetter man to petronize than Mr Morse. He is affahle and respectful to all.

THERE are many persons who do not know how to stop a newspaper. They are more awkward about it than a country hoy stealing his first kiss. The way to do it with satisfaction to both sides is to address the pnhlisher by letter if you do not live near enough to call at his office. It is no way to notify the postmaster or some one else. Fonr postmasters in three will fail to notify the office of publication. They look npon it as your business more than theirs. The right way is as genteel and pleasant as the other is suspicious and shahby. If you owe for a few weeks or months over time, tender the amonnt due. It is a little thing, hut it will he a greet sati faction to your conscience, as every one is presnmed to have one of some kind. Stop yonr newspaper like a man, and your own self-respect and the esteem of the publisher is maintained. Then you can always look him in the eye or take him by the hend, and he will feel proud to think you were once one of his most gentlemenly petrons, and wish you wonld snbscribe again.—*Exchange.*

APPRECIATION ABROAD.—We copy the following from the *Mining and Monetary Gazette*, of London, Eng.: "We deemed it advisable, as affording valuable information to our readers, to publish in recent issues of *The Gazette*, the full text of the "United States Mining Lawe and Instructions, by the Commissioner of General Land Office," taken from our talented contemporary, THE MINING ANN SCIENTIFIO PRESS, of San Francisco. The documents have now been issued in a handsomely-bound volume by Messrs. Dewey & Co., the publishers of our transatlantic contemporary, and it will be found very usefnl to those already interested in American mines, and to others who may be tempted to embark in that enterprisa in the States."

Newspaper Fileholders.

Dewey's new elastic fileholders (black walnnt), size of the PRESS, *Harper's Weekly* and *Scientific American*, for 50 cts. Larger sizes, to suit any newspaper, 75 cts. By mail, postpaid, 10 cts. extra. Cash with all orders. Patent allowed. Address, DEWEY & Co., Publishers, San Francisco.

Mining and Scientific Press,

Is tha leading mining journal in America, and enjoys a large circnlation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of tha Pacific Coast, it is decidedly popular and a standard ournel with the most thrifty industrial people of tha Pecific States and Territories. Ite enthority is of the highest order, and its usefnlness in its special sphere unrivalled.

Every public library, mining angineer, metallnrgist, mining operator and intelligent mechanic and mannfacturer will find profit by its reading.

Subscription, $4 e year, in advance. Semple copies post peid, 10 cents. As an

ADVERTISING

Medinm for the Pacific Coast, it is snperior to any other journal for all kinds of mining and hydraulic machinery and other mechaniool work, building meterials new menufactures and inventions. Our rates are very reasonable compared with those of other first-class journels. DEWEY & CO., Publishers.

Much Obliged, Etc.

PORTLAND, CON., Jnne 28th, 1876.

DEWEY & Co., Patent Solicitors, S. F.—*Gents:* I am much obliged to you for courtesy shown me, and am well pleased with the manner in which yon have done my husiness, and assure you, will cheerfully recommend you to my acquaintances needing such services. Hope to have a cese egein before long, of my own. I have heen an inventor all my life, hnt let others reap the henefit, or had work stolen from me. Plesse have the extrs copies of my petent, etc., mailed to me direct, end oblige Yours trnly, J. H. WOONRUM.

SAORAMENTO, May 29th, 1875.

MESSRS. DEWEY & Co.—*Gentlemen:*

Yours of the 27th inst. is received. The petent cema duly to hand yesterday, hy express. Please accept thanks for your promptness in ohtaining the same.

Very respectfully, DUNCAN BEAUMONT.

To Mining Secretaries.

An smendment to Section 338 of the California Coda, taking effect July 1st, 1874, provides that in addition to the regular publication, daily or weekly, of the assessment and sale notices as heretofore,

PERSONAL NOTICE

Must he served as provided in the following qnotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his ploce of residence, if known, and if not known, at the place where the principal office of the Corporation is situated."

The ahove refers to the ASSESSMENT NOTICE only Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitahle for serving personel notice under this law at short notice.

DEWEY & CO., Publishers.

PICKERING ENGINE GOVERNOR.

Vallejo Foundry, October 17th, 1876.

MESSRS. NEYLAN & YOUNG, San Francisco.

Gents:—The 10 two-inch Improved Speed Adjusting Governors I bought of you this year for my Patent Straw Burning Threshing Engines give splendid satisfaction. They far surpass for regularity of speed any Governor that I have ever seen, and I have seen all of the best kinds; I have seen the main belt fly off the pulley several times this season while threshing and the engineer did not discover it, so perfectly was the speed maintained, until he was told of it; this I consider something wonderful; I consider the Governor absolutely perfect, so far as speed is concerned. I bought, and put on to one of my engines a Shiva Governor, to see which was the best end after one season's trial I have no hesitation in saying they are as far superior to the Shive. or any other Governor that I have seen or used, as the Shive Governor is to the old Butterfly Valve Governor. I wish you would send me the lowest price that you can furnish 25 Governors for next season's engines.

Yours, respectfully, I. L. HEALD.

THE
LANE & BODLEY COMPANY,

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING and TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

A. J. SEVERANCE & CO.
Office, No. 426 California street, Room 1.

THE O'HARRA
CHLORIDIZING FURNACE.

Guaranteed to Chloridize from $5 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing by this Process:

Two cords of wood at $8	$12.00
Two firemen at $4	8.00
1500 lbs of salt at 1½c	22.50
Wear of shoes and power	1.50
Cost for 15 tons	$44 00
Cost for one ton	2.93½

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Consolidated Co.'s mines, in the Pesvine District. For further information, apply to

D. J. O'HARRA,
Reno, Nevada.

"Faith and Confidence"

LIVERMORE, Oct. 1st, 1875.

MESSRS. DEWEY & CO., Patent Solicitors: *Gentlemen*—Yours of the 29th ult. containing my patent to Elevated R. R. duly received, and I hereby return my sincere thanks to the MINING AND SCIENTIFIC PRESS Patent Agency for your promptness and honesty in regard to our busine s connections. I have received a flood of circulars from Eastern firms, desiring to deal with me, but I have declined any communication with them and prefer, as soon as circumstances will permit, to negotiate with and patronize a home institution; one in which I have faith and confidence—DEWEY & Co.

Again thanking you for your promptness in securing my patent, I remain, obediently yours,

WM. H. HARRISON.

GOOD PRINTING INK.—We prefer Ches. Enen Johnson's printing inks, having used them on this paper for the past four years. H. S. Crocker & Co., printers, stationers, blank book and paper dealers, are Johnson's S. F. agents.—DEWEY & Co., Publishers.

Thanks for Prompt Attention.

STOCKTON, June 26, 1875.

Messrs. Dewey & Co., S. F.—

I have received the patent for my invention in wagon brakes, which you prosecuted for me; patented May 11, 1875—No. 163,046. Thanks to you for your prompt attention to the case; you will hereafter be my attorneys in such cases. I recommend all inventors on the Pacific coast to give you a call, which I think they will never have any cause to regret. Very truly yours,

GEO. G. BUCKLAND,
Stockton, Cal.

OCAMPO, SAN DIEGO CO., CAL., July 3d, 1874.

MESSRS. DEWEY & Co.—*Gentlemen:* To-day I received the patent and other papers of my animal trap, that you so successfully worked through the patent office for me, for which please accept my best wishes. The chances are that I will have another application for you to make for me before long. I am well satisfied with your manner of doing business, and I think inventors of this coast stand in their own light when they do not put their business into your hands.

I remain yours truly, A. M. GASS.

Amusements.

Mechanical Ore Concentration and Separation.—No. 15.

[Written for the PRESS by FRANCIS M. F. CAZIN, M. E., Santa Fe, New Mexico.]

During the nine years that I followed the special trade of mechanical mineral concentration on this continent I have endeavored to simplify matters, to reduce cost of plant, and to dispense as much as possible with skilled help. As a result of my work in this direction I present the

Combination One-Plunger Jig

I feel a very natural reluctance to say anything with regard to this machine bearing my name, and would not impeach the good that can be done by this treatise by giving room to the suspicion that selfish motives had inspired some of its statements or influenced my judgment. I therefore only mention the machine, leaving the appreciation of it to what practical chances it may further get. In Vol. XXVIII, No. 21, this machine is described as it was in an earlier stage of its practical development. In addition to the sketches there published the annexed sketch will give a full idea of the machine in its present stage.

I claim for it, that it adopted and maintained all good features of the Hartz jig; that in one machine it is adapted to all sizes and to all kinds of concentratable ore; and that with less outlay the same purpose can be achieved by it as by all four kinds of the Hartz jig. It is made to work two sizes at the same time, having a separate row of sieves for each and a screen, *R*, to receive ore previously sized once, but containing the two sizes to be divided by it between the two rows of sieves.

The following description of the action of a jig applies more or less to all continuously working jigs of whatever make they may be:

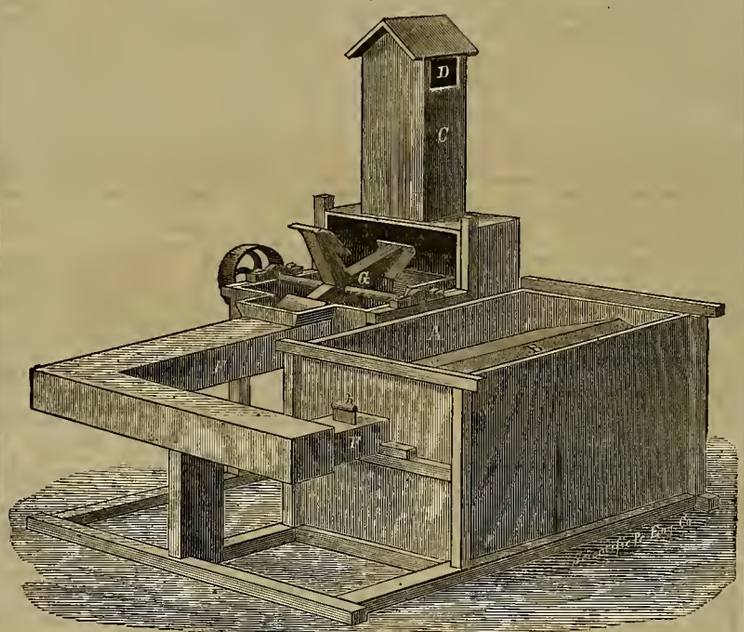
Jigs are intended to produce a vertical upward stream of water, to expose to this stream particles of ore and rock of equal size, in order to distribute locally these particles in the stream according to their specific gravity; further to interrupt the vertical upward stream in order to permit the deposition of particles on a sieve bottom, and allow those of higher specific gravity to deposit closer to the sieve bottom than of less specific gravity, to give a separate outlet to the different materials, to supply the crude ore and discharge the separated and concentrated material automatically and continuously.

The vertical upward stream in this machine is produced in the body *A*, *A*, of the jig filled with water to the line *H*, by pressing down a plunger *H*, lying near the surface in the water in the center of the jig, and thus driving the water around and under the partition *N*, *N*, and up from under and through the sieves *B*, *B*, on which sieves the particles of ore to be separated are lying.

The crude ore is coming to the jig from its upper end, as shown in the formerly published cuts, with a horizontal stream of water in the proper proportion. The upward vertical stream is interrupted by the plunger being allowed to return to its former position. The water would naturally flow back and bring the particles into their intended position on the sieve-bottom, as it is not desirable to expose the particles to the same violent stream downward as they were exposed upward, because the lighter motion of the parts would thereby be proportionally accelerated; the back flow is lessened partly by a mechanical contrivance giving more time to the back lift of the plunger than to its down-pressure, and partly by permitting a supply of water to flow under the plunger from a sufficient head, by which supply the space resulting from the back motion of the plunger is partly filled, resulting in so much less water flowing back through the sieves, and the back stream being so much lessened in speed. The sieves being provided with meshes of the same size as the size of ore flowing to the jig, the particles closest to the bottom being of the highest specific gravity will continually and automatically pass through the sieves and deposit in the funnel-shaped bottom of the jig and discharge through the valves *k*.

Flour Cooling Attachment to Grist Mills.

The invention illustrated on this page is designed to facilitate the bolting of flour and prevent the meshes of the cloth from becoming clogged, thus obtaining better results with less bolting surface and also preventing the bolt chest from sweating. These several advantages are accomplished by the inventors—Hurd & Simpson, of Redwood City—by the simple introduction of one or more currents of fresh air into the flour bolt in which the flour is bolted, so that the flour as it is agitated by the rotation



FLOUR COOLING ATTACHMENT TO GRIST MILLS.

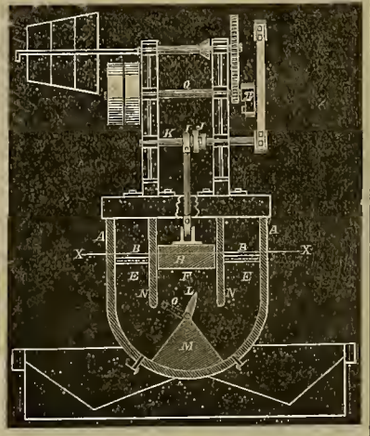
of the bolt will be subject to the cooling effects of the current of air.

In the engraving, *A* represents the bolt chest and *B* the bolt of a grist mill. In order to cool the flour, a current of air is directed either into the bolt itself or into the bolt chest. In this instance a stack or flue, *C*, is represented, which projects upward through the roof of the mill and in which suitable openings, *D*, are made to admit air. This flue is then connected with the bolt or bolt chest by a pipe or tube, *F*. At some suitable point in the length of the pipe is placed a blower, *G*, which will draw air through the openings in the flue and force it in a current through the tube into the bolt or bolt chest. The inventors profess, as represented in the engraving, to force the air into the bolt so that the flour as it is agitated by the rotation of the bolt will be subjected to the cooling effects. This arrangement also gives a better result in keeping the bolt chest and bolt cloth cool, at the same time thoroughly agitating the flour and forcing it through the meshes of the cloth, so that it cannot pack or collect on the cloth. It also prevents the flour from sweating and clogging the interstices of the bolt cloth or sweating in the bolt chest, so that better results are produced with less bolting surface than is ordinarily used.

The blower is driven by a belt connection with the running gear of the mill. One or more dampers, *h*, can be used in the length of the pipe to regulate the supply of air. Branch pipes could also be applied to lead a part of the air to other bolts or bolt chests.

A very material advantage in using this invention is that no additional machinery is required except the blowers and air pipe, which become a stationary part of the mill. This patent was procured through the MINING AND SCIENTIFIC PRESS Patent Agency, and the inventors, having had considerable and extended experience in the practical working of the invention, have confidence in recommending it to the milling public. The invention is really a useful one, as it overcomes a difficulty which millers have long attempted to obviate. Those desiring further information may address "Flour and Bolt Cooler company," 115 Mission street, this city.

THE RESPONSIBILITY OF STOCKHOLDERS.—T. Robinson Bours, a creditor of the Quintero mining company, brought an action in the Fourth District Court to recover the amount of his indebtedness from the stockholders of the company. The complaint contains three counts, viz., for goods, hire of mill, and an account stated. The defendants interposed a demurrer, and in passing upon the demurrer, Judge Morrison said he had held that an action would not lie against a stockholder on a promissory note of the company. An appeal was taken from the decision and the Supreme Court confirmed it. He could see no difference in an action on



COMBINATION ONE-PLUNGER JIG.

a promissory note and an account stated. The liability of a stockholder did not grow out of the statement of an account, but out of the original transaction. The complaint in this case fails to show whether the indebtedness was for goods or for services. The indebtedness ought to be fully stated in the complaint. The demurrer was therefore sustained.

Mining Information Wanted.

The Government, now that the silver question has become so prominent, is taking steps to obtain more detailed information than heretofore in relation to the mines, and the following circular has been issued:

All mining companies located upon the Comstock are respectfully requested by the United States Monetary Commission, authorized by Act of Congress, dated August 15th, 1876, to prepare a statement showing the following items:

1. Amount of capital stock.
2. Annual revenues of company.
3. Annual expenditures, divided into principal heads.
4. Annual product of gold and silver, separately, as ascertained from assay certificates or bullion account.
5. Inventory of property at latest date.

No estimates or conjectural statements are desirable. Send statements to Alexander Delmar, room 76, Palace hotel.

We hope that the companies to whom this is sent will respond heartily and will take pains to make their returns as full as possible. In this connection, however, it is proper to suggest that although the Comstock is the great mining center, there are other districts which produce sufficiently to entitle them to consideration also. Some of the large companies in Nevada which are off the Comstock, are making creditable records, and at this juncture, when a report is coming from the Government, they should be recognized officially. Considerable grumbling is indulged in because on California street they turn up their noses at anything not on the Comstock, and imply in that way that nothing is worth having which is not on that famous lode. But now, when a special commission is ordered by the Government to collect statistics with relation to the silver product, they should not confine their researches to a single lode because that produces more than all the others put together, but should ask the same questions of large *producing* mines in all sections of the country.

Were it not that they suffer by comparison with the Comstock, several other districts would be considered as producing quite respectable sums, but the bonanza mines have turned out such immense amounts that unless production is counted up by the millions a mine is thought to be rather small potatoes. When it is remembered, however, that these mines are remarkably exceptional in their richness, and that the product is about half gold after all, it seems proper that silver mines in other parts of Nevada should be represented in the statistics collected and be credited by the public with the amounts they have produced. Moreover, it would have the effect of drawing out and making public, in a convenient form, figures now difficult or impossible for individuals to obtain, and would disseminate a very valuable kind of information which would in the future be of benefit to the mining interests.

BULLION SHIPMENTS.—Since our last issue shipments from the prominent mines have been as follows: Challar, Dec. 19th, $14,792.86; Manhattan, 19th, $12,000; Northern Belle, 17th, $10,311.95—total to date, $50,034.23; California, 19th, $91,483.66—total to date, $323,285.48; Modoc, 18th, 464 bars—total to date, $71,590; Tyho Con., 16th, $4,731 21—total to date, $22,277.80; Gila, 22d, $5,516; McCracken Con., (A. T.) 21st, $3,500; Leopard, 18th, $4,147.90; Washington, 20th, 302½ oz. bullion; Northern Belle, 19th, six bars bullion, value $9,039.22—total to date, $59,073.45; Modoc, 20th, $5,000—total to date, $76,590; Manhattan, 22d, $12,177; Modoc, 24th, $6,000—total to date, $82,590; Manhattan, 26th, $12,400; Tyho Con., 20th, $15,148.15—total to date, $37,426.10; K. K. Con., 23d, $4,000—total to date on December account, $43,000—total for year 1876, to date, $200,000; Northern Belle, 24th, $16,498 16—to date, $87,225.80; Arizona, 24th, $2,766.93; Justice, $66,052—total for December account, $155,609.

THE compressed air in the Sutro tunnel, for driving the drills, etc., is forced a distance of 9,000 feet, the machinery being situated at shaft No. 2.

CORRESPONDENCE.

Some Facts from the Black Hills.

"Up to the hills on a bright sunny morn,
Voices clear as a bugle horn,
List to the echoes as they flow,
Here we go, we go, we go."

The cry is still heard, away to the Black hills, to Wolf monntein, or to the Big Hern. As an opportnnity has been hed of interviewing several individuals recently from the Black hills, a few facts with reference to the gravel and quertz at Deadwood and some adjscent localities may not be amiss. Tbe extent of the placer mines, nortb and sonth, is about 90 miles, with a width of ebout 40 miles. The slate and granite are not found ontside of this limit, unless at Wolf mountain, abont which many exciting rumors ars afloet. Everywhere else, so far as prospected, the conntry rock is mostly sendstone and limestone, end placer mines and gold quartz have been found. In the mein camp, the principal gulch is Whitewood, in whicb gold has been found in paying quentities the distance of 10 miles. Deedwood gulcb, the richsst in the district, empties into Whitewood, at Deadwood City. From this place to Gayville, a little upwards of two miles, there are 33 claims, fifteen of which heve been exceedingly rich, some of them peying $30 per day to the man, and a few ruuning es high as $400 or upwards—the remeinder probably averaging from $10 to $15. For a mile above Gayville, good pey is believed to exist, but tbe ground is deep and difficult to prospect. Deedwood has two small trihoteries with from 12 to 15 cleims on eech, all of which have paid wages, end a nnmber as mncb as $50 to the men. Gold run, which empties into Whitewood two miles ahove Deedwood City, has been e very rich gulch, peying probebly on en average from $15 to $18 to the man—some cleims considerebly more. Tbe smaller side gulches yield something over wages.

There are some other gulches in the vicinity that cut the hills in a different direction, which will be mede to pey when snfficient weter cen be introdnced. The mejority of the claims are sbellow, and some of the richest are already worked out—this is the cese probebly with one-half of Deedwood gulch, togetber with the lower end of Bobtail, and most of Blecktail, tributaries of the same.

There ere, however, said to be meny acres of bar diggings in the hills adjecent to Deedwood City, that will pay well with a supply of water. Taking these witb tbe fact tbet the gulches will be worked over and over again, as is ususlly the case, there will probably be more or less placer mining there for some years.

At the southern end of the hills, in Rabbit creek and Cnster City districts, there are a good many bars where they are making from $3 to $5 per dey, with better pay expected when bedrock is reached, which had not been done except in one instance, on a tributary of Rabbit oreek, which is reported as giving very promising resnlts.

There is a considerable scope of mining ground both at Custer City, and also at Bear gulch, 25 miles sonthwest of Deadwood, that pays wages for a short time while water lasts.

The Quarlz Ledges of the Black Hills.

In Deadwood district tbere is a belt of quartz lodes from two to three miles wide, crossing the gulch of the same name, on which several hundred locations have been msde, meny of which, as a matter of course, are entirely worthless except as a "sell."

Some of the lodes have been partially developed, showing one or more well defined walls of slate, and trap or porphyry, the former usually on the hanging wall, with a width of 10 or more feet, and in cases thougbt to he not less than from 30 to 40 feet wide.

The quartz is gold bearing, and going in Government assays at Philadelphia as high as $1,000 per ton, with others reported as running high up ioto the thousands.

One thing may now be taken as an established fact, that there are many valuable lodes tbere, with an immense amount of very high grade ore. Mr. J. P. Bernes, a close observer and an experienced miner, to whom I am indebted for most of the statements herein made, and which may be looked upon as in every respect reliable, spent three months in the Black hills the past season. He examined many of the qnartz claims and spoke of some of them in the highest terms, more particularly of tbeir apparent prospective velue.

He also made a location on his own account, sinking a shaft 12 feet, and making a crosscut. Both walls were fonud and a solid vein of quertz six or more feet in width.

From certain tests mede by tbe best facilities at hand, he thought it ought to yield $100 or more to the ton. Judging from the caution manifested in most of the statements made, his estimate wes probably muoh too low. Another rich lode hes been recently strnck right in the heert of the town, and tbe excitement io quartz is running high.

Two towns are being built up, on the strength of tbe belief in the permanent value of the mines. Much prospecting is being done. Several mills are expected to he put up the ensuing season, and if tbe Indians are thoroughly whipped out, as reported or looked for, a lively time may be anticipated.

Heving tnrned eside a little on accnnt of the generel interest in this comparatively new mining region, the

Placer and Gravel Mines of Meagher Co., M. T.

Will now be concluded, my last having olosed with the mines aronnd Diamond City. Some eight miles from this place, across the divide, is Elk creek, where the diggings have been profitably worked for the pest seven years.

Messrs. Kelly, Bull & Co.

Have a good claim of 115 acres, United Stetes patent. Having previously had a speoial survey, they have been enabled to secure eight hars and four miles of gulch, giving them a property not only of greet present value, paying $6 to $7 per day to the man, hut likely to prove remuneretive tbe remainder of their nstural lives.

At White's gulch, five miles below Diamond City, Mr. W. J. Bristol has a velneble hydreulic claim of 2,000 feet in length on tbe ber, with 25 feet in depth of pay gravel—the ohannel said to he 400 feet wide. It peys $15 to the men. His gulch olaim runs from $6 to $8.

The Messrs. Harrington have ground edjoining of the same extent end of like character. Hendricks & Co. have a drift claim in the gulch witb 100 fest of channel, averaging $5 per day to the men. Messrs. Bennett & Lewler have struck good pey on a bar 100 feet above the bed of John's gulch, making into White's, that pays $40 to the six-foot set—that is, six feet front, with four foot back end probably as meny feet deep. In Avalanohe, still lower down on the Missonri river, pay was first struck lest season. Tbis gnlch is now attracting a good deal of attention, and a good time is expected next spring.

In Magpie e drain has been started and fine prospects are believed to be aheed. Near this gnlch, Messrs. Rotwitt, Stagner & Co. have e fine hydraulic claim of 120 ecres, the only drawback being the high water rates. The gravel is from 3 to 15 feet, with about five feet of dirt, that paya es high es $40 per day to tbe men.

Next in order is Cave golcb, within a mile of Cenyon Ferry. Six companies have been et work the past seeson.

Tbe cleims are located on a bar or old river channel, judging from tbe bones of the elephant and also of the mastodon, uneerthed here near the bedrock.

The extent of the gravel is ebout one mile in length, with a depth of from 20 to 60 feet. There is more or less gold in the whole hank, hut richer neer tbe bedrock, and is worked by hydraulic. It is a fact worthy of note that this is the only gulch wbere quicksilver was used to any extent, the particles of gold not being so coarse es those heretofore generally met with. Undercurrents and other appliences for saving fine gold heve heen nowhere seen in the Territory, and they are probably not needed owing to the coarseness of tbe gold.

The Island Co.,

Better known as the claim of Hortop, Pbillips & Co., may he taken as an illustration of what is being done on a somewhat similar scale, by the other companies. This claim is 2,000 feet in length, and in some places a fourth of a mile wide. It averagea $10 per day to the man, some clean-ups returning double the amount.

There are probably upwards of $150,000 extracted annnally from the bar and gulch, as one firm bere, out of three engaged in buying dust, purchased last year to the extent of $80,000.

A. C. K.

Globe District, Arizona.

EDITORS PRESS:—The mill of Morril & Ketchen is doing good work. They worked a few tons of ore and turned all their quicksilver into amalgam. They had over 1,000 pounds of mercury on band for a start. Not having any retort on hand they had to shut down until it arrived. To-day, Dec. 11th, they have started np again, and everytbing is working splendidly. The yield of silver from the amalgam was immense. The ores worked by them averaged 700 onnoes per ton. Considerahle ore that assaya from pulp semples $3,000 to the ton is on hand.

Tbe mill of Fresb & Co. started up last Friday. It is rnnning on ore from the Alice mine and it is doing good work.

The furnace of Messrs Beebe & Kennedy will be reedy to run about the 20th inst. They will handle the refractory ores, using the lead ores of the district as a flux.

The shaft at the Buckeye mine is now down 60 feet, with a 2-foot vein of very rich ore. There is fully $40,000 now in sight.

Sinking the sheft at the Perdez mine is going aheed rapidly. Their ore milled 500 ounces to the ton. They have heen offered $60,000 for the property, but they don't want to sell.

Richmond hasin is turning out plenty of nnggets of silver. They have taken out of the Hoodoo claim over $35,000 in nuggets already. Tbere is some left yet.

The Miami mine is looking splendid. They have got 15 feet of solid ore that ruos up in the thonsands. They are working quite a force of men, and are going ahont the rigbt way to develop their valuable property.

Borns mine is showing native silver. Capt. Barns, the owner, is busily engaged getting out ore to have it milled. The assays mede from ths dnmp sbow the ore to contain 700 to 800 onnces to tbe ton.

The McMillan mine is turning ont 3,000 ounces of ore. They are getting soms of this out to heve milled. Their ledge is 70 fest wide, and traceable for over seven miles. They have got a king mine.

The Blne Bird mine is showing plenty of beeswax, or cl. bromide of silver. They also are having some ore milled.

G.

Old and New Mining Districts.

EDITORS PRESS:—The periodical mining excitements thet nsed to carry everything by storm in this State in previous years, seem to have become things of the pest; and so much the better for mining and its dependent interests. During one of tbose excitements it was no nnnsnal thing for half the population in some of the older mining districts to scrape together a meager ontfit in the way of psok animels or mustang teams, with a little flenr, bacon end otber staple stcsteres, and, regardlsss of time or seeson, go in quest of the new El Dorado, its imaginary resonrces and wealth—at last to find only disappointment, and then returning to their old homes wearied and impoverished of their soenty means, hut, from hard and costly experience, with tbe knowledge that tbey had jnst as good mines at home.

It is neerly always the oese, however, witb mines situeted in districts that have been organized in pest years, end without any attendant excitement, tbet something in the way of exceptionally rich developments must be sbown to attract the attention of those who can afford to pusb such mines into their legitimate place in the market. In this (Nye) county there ere several districts thet were orgenized some ten years ago, that still count amongst tbeir sparse population those who were pioneers, end who still patiently work and wait for a reqnitel of their perseverance and lehor, their current expenses being defrayed, in most cases, by tbe marketing or reduction of smell lots of ore, cerefully selected so as to stend off tbe cost of trensportation for long distences, and leeve a margin for profits.

Amongst the older districts in this category may be mentioned Union distriot (Ione), Mammoth district (Ellsworth), Danville and San Antonio. Tbe two first nemed have lately heen tonched witb the golden wend of capitel, and in a sbort time will send out their treesures. In tbe lest named district, San Antonio, a large amount of work has heen done since its organization in '63, mainly upon the Lee, Liberty and Potomac series, and from the Liberty and Potomac ores to the amount of 200 tons have been hauled an average distence of 75 miles, to the nearest mill then running, that gave a return of more tban $150 per ton, besides some 900 tons that was hauled a distance of 12 miles, to a little four-stamp prospecting mill, that yielded something over $100 per ton. In cases like this just instanced, no one has clearer appreciation of the wastefulness of hauling ore such long distances than the miner or prospector himself. But the means of sobsistence must he had, as well as powder, tools and other appliances for mining, and whetber the distance be long or short, the cost great or small, necessity rules. Tbe condition of the older and partially prospected districts of this county, as above described, is quite commonly met with ell through the central portion of tbe State.

Now, when capitalists choose to invest something in mining, wonld it not he better for them to look over the old ground before taking an extra hazard in some new district where tbe first fever of expectancy mekes everything rose colored, and so often leads to failure? In Columbus district, such mines as the Northern Belle and Gen. Thomas went begging for capital for years without success, during which time newer districts rose into prominence, exploded their pretensions and were forgotten.

ICONOCLAST.

Belmont, Dec. 13th, 1876.

A CHANCE FOR INVENTORS.—Tbe *American Manufacturer* says: Steel and alloys are now manufactured of such density as to necessitate the discovery of new means of working them, especially where positive accuracy is required. Steel cutters may not hold their edge a snfficient time to traverse the full extent of a face on substances so rigidly hard, therefore it is important that a snbstitute be found of such durability as to retein its cutting edge intect, prodncing the same trneness and accuracy of surface at the end of the work as at the commencement. Such a tool, when known to exist, will no doubt prove a valnable ecqnisition end be eagerly sought for. To obtain a tool of this description, the Societe d' Encouregement poor l'Indnstrie Nationale, of Paris, has generously offered one of their largest prizes to he awarded in 1877, for the artificial preparation of compond black diemond—commonly known by the neme of port or carbonate—for obtaining thereby a powerful means of aotion for working hard metal substences, etc.; this prize being open to inventors in all countries.

Comstock Papers.

No. 14.

Savage,

Who had been a miner at Downisvills, went over tbs monntains in tbe snmmer of 1859. Soon after his arrival at Virginia City, he, in conjunction with two or three others, bought the ground that now carries his name from a party of "jumpers," satisfying at the same time the demends of ths contestant claimants. In 1860 he was engeged in packing goods over tbe Sierra, but soon after disposed of his mines and having some money, ceme to Californie, where he pnrchased lend, npon wbich he hes for many years resided, a staid and prosperons farmer.

William Chollar,

Whose name is connected with the Cbollar Potosi, was elso a California miner. He went to Washoe in the fall of 1859, loceted the Cboller gronnd, in which he held the usual two-hundred-foot claim, and undertook to explore it hy means of a tunnel. This, though a costly work, evailed nothing, therefore he sold out and taking the proceeds of the sele retnrned to his home at Grass Valley, and there agein engeged in mining. He was a olear-beaded business man, active and industrions, but being of a convivial disposition, et times spent his money levishly. Some seven or eight yeers ago, at the earnest solicitstion of his brothers living in Connecticut, he went home to tbat State, where he is reported to have since died.

Triglone, Trench and Overman.

John Triglone, once owner of the Triglone cleim at Gold Hill, is now and for some ten or twelve years agone has been a well-to-do quartz miner in Amador county, California. He did tolerably well over in the land of salt, sage-brnsh and silver, heving, besides his mining ground, been a large owner in the Swansea mill, whiob for some time made handsome net eernings. The Trenoh olaim, covering twenty linear feet in the heart of tbe rich sbnte at Gold Hill, was bonght by Joseph Trenob and Erastns Sparrow in the fall of 1859, these parties baving the next year put up a lerge and well appointed mill at the mouth of Amerioen ravine, whioh was run for several years with large profits upon the ore taken from tbeir mine. Sperrow, who wes already an old men at the period we ere speaking of, died severel years ego. His pertner in tbis enterprise still lives, an energetic, stirring man, as notioeable for bis sturdy physique es for his kindly disposition and good natured bonbomie. He ia supposed to he financially well off. Overman, the lest in this category of nemes, (as this cleim is also tbe lest on the universally recognized line of the Comstook lode), helonged to tbe Washoe mining pioneers. This circumstance did not, however, profit him greatly, as he parted with his interest in the ground that hears his name for a trifling consideretion. In the snmmer of 1859, be wes living in a log cahin near this spot, a quiet, elderly man, still eerning small weges in the nearly exhansted diggings along Gold canyon. He died in Washoe several yeara ago, and was buried near the scenes where he had so long lived and labored.

Leeds' District, Utah.

A correspondent of the Salt Lske *Tribune* says: Pioche no longer stands alone in pouring ber population into our midst. Californie. Montana, and Northern Utah are sending representatives to co-operate with us in building up Southern Utah. The emigration is increasing, and daily we notice the arrival of from four to ten wagon loads of miners and business men. Nearly all who select our camp are of the better class; but few of the desperate characters who usually are the first in new mining towns are seen here.

Capital is coming in, bnt slowly, though we are in receipt of letters informing us of the intention of several of San Francisco's heaviest capitalists soon to come.

The Leeds mining company's representativea have returned, and immediately commenced the erection of their mill, only a portion of whioh has as yet arrived. They expect, however, to place it in position as soon as it arrivea, and to be in running order in less time tban most people expect.

Dnpaix's mill is almost completed, and will be in running order within a few weeks.

Many new prospects are being developed. Prospectors are lining the hills, and many report rich discoveries. Before spring this will be the largest miniog town ever on this ocast.

MINUTE SUBDIVISION OF COLORING MATTER. The remarkably minute quantity of dyestuff required to tint an otherwise colorless liquid, such as weter or alcohol, is well shown by Herr Annaheim in a paper presented to the Berlin Cbemical Society. He diesolves .0007 gramme of fnchsine in alcohol, and dilutes the solution to 1,000 cubic centimeters, so tbat each centimeter conteins .0000007 gramme of fuchsine, an amount of color which appears quite strong when backed by white paper. By still further experiments he shows that .00000002 gramme of fucbsine is perceptible as color by the human eye, and by calculation that the absolute weigbt of an atom of hydrogen in a molecule of the dye cannot exceed .000000000059 gramme.

MECHANICAL PROGRESS.

Automatic Nail Feeder.

The Youngstown (O.,) *Register* says: One of the most novel, simple and ingenious pieces of machinery that could possibly be imagined has just been constructed and is now on exhibition at Booth, Miller & Co.'s foundry. It is an automatic nail feeder, invented by Wm. Koplin, of New Castle, Pa. An exhibition of the perfectness of the machine was given on the 10th inst., in the presence of a number of mechanics. The inventor, Mr. Koplin, was present and watched the workings of the feeder with as keen an interest as any one else. The machine was cutting a four penny nail, perfect in workmanship and with a rapidity unparalleled. The principle is a revolving feed barrel, or cylinder, into which the nail plate is inserted and fed to the machine. The barrel is open and is firmly locked at each half revolution. It is resolved by means of a cog-wheel with blind teeth. Below this cylinder is a cam shaft, to which the power is attached and to which the cog-wheel is firmly attached, then by a combination of the feed barrel, cam yoke and spring, the nail plate is raised or lowered and fed into the machine. As the cylinder revolves, the instant the nail is being cut the barrel is locked solid by means of mutilated pinions. The cam shaft above referred to makes the motion positive and regular, there is no gravitating or vibration, but each motion is positive and perfect, never varying no matter what speed the machine attains. At the right of the feeding barrel is a "clearer" attached, which passes under the plate at each revolution and clears away the scrap, thus obviating the great difficulty that has hitherto attended all machines of this sort. It will be observed that the plate is inserted in the barrel and forced down at each half revolution, being cut just as a man feeds a machine in our nail factories, and when the "stub" or scrap reaches the knife the clearer strikes it and throws it aside. The nailers present yesterday all expressed themselves that the machine was the only one of the kind that was perfect. If it is desired to vary the size of the nail, a screw is adjusted and the heads and points are altered at pleasure. In case it is desired to make a nail of heavier weight, the feed barrel is made large enough to admit of a wider plate, and the change is made. Mr. Koplin states that he has designed an attachment, which, when placed at the mouth of the feed barrel, will enable the machine to supply itself with the nail plates, by which arrangement one boy could attend to a dozen machines. The machine can be built at an average cost of less than $20.

Strength of Cast Iron Fitting-Blocks for Boilers.

Cast iron fitting blocks are used freely by boiler-makers, under the impression that such blocks, while of small diameter, compensate for the weakness caused by the hole which the block goes over. There is, however, reason to believe that this impression is erroneous, and Mr. Fletcher, of the Manchester steam users' association, deprecates the use of such blocks very strongly. The *Engineer* gives an engraving from a photograph of the fracture of a cast iron mouthpiece or fitting-block at the base of a six-inch steam stop valve. The casting was very good and sound. The pressure was 275 pounds on the square inch. The plates of the 7-foot boiler shell were seven-sixteenths of an inch thick, doubled riveted, and carried 342 pounds before giving way. It is evident from this that the cast iron fitting-piece did not compensate for the loss of strength in the plate caused by cutting a six-inch hole in it. A point worth notice in cutting holes in boiler shells has never received the attention which it deserves. These holes are very frequently left ragged at the edge, and if closely examined it will be found that minute cracks radiate from them into the plate. The weakening influence of such cracks, however small and short, is well understood. In all cases the edges of holes in boilers should be cut off clean and sharp, and the general use of some modification of the rose cutter, which would smooth off holes up to six-inch in diameter, would be a very good thing.

THE SMALLEST TURBINE.—One of the most diminutive motors that has ever come under our notice that could be put to a practical use, says the *American Miller*, was a turbine on exhibition at the Centennial. The tube is three inches long and five-eighths of an inch in diameter, with an oblique inlet designed for attaching it to the faucet of a water pipe. On entering the tube by the inlet, the water passes a stationary wheel provided with a series of radial vanes, and leaving these it strikes a similar wheel, which is caused to rotate by the spiral motion which the water has acquired from passing through the vanes of the stationary wheel. A spindle and pulley connect with this wheel, and to the pulley is attached an endless cord, through which motion can be transmitted to machines requiring a moderate amount of force to propel them. The water, having been utilized, is conveyed away by a closely fitting rubber conduit which is drawn over the outlet of the pipe. This little turbine, for in principle it is nothing less, can be utilized in a variety of household operations. One of the dimensions stated above will furnish power sufficient to propel a sewing machine.

Planing Mill Machinery.

A writer in the *Northwestern Lumberman* gives some hints concerning the construction and care of planing mill machinery. He says:

I would say to those who contemplate putting in new boilers, to get such as will generate the most steam with the least amount of fuel, and for this object tubular ones stand at the head. It it true, the old Corlish boiler has many advantages over this style, and is claimed by some to be far superior to any other for planing mills, but I have failed to find it so in practice, and I have used almost every kind made and under all circumstances have found the tubular, if properly set, far superior. If you are to get new boilers, go to some reliable firm, who have a good reputation, tell them to what use you wish to put the boilers and that they must be made of the best refined iron, put together in the best possible manner, as a planing mill is one of the worst places known to put a boiler, for the reason of such unsteady fires which cannot be avoided where shavings are used for fuel, especially when bituminous coal is mixed with them.

The engine room should be built as remote from the machines as possible, for the purpose of avoiding the dust, which will more or less find its way to the engine, in spite of all the care that can be exercised in that direction; and for this reason I would recommend an engine built with as little brass and bright work as possible, as it cannot be kept clean without being continually wiped off, and engineers soon get tired of this; the consequence of which is, it goes about half clean; then it looks worse than the rough iron painted, as this can be wiped once a day and look comparatively clean. It is very different with a planing mill, than a machine shop, where there is no dust and it is an easy matter to keep an engine bright and clean. Another thing which proprietors of mills should look well to in getting steam power, i. e.: The amount of it; be sure that you get your engine and boilers large enough to drive easily all the machinery at once that you intend to put in, and just a little extra from the figures will be in your favor in the long run, for there is no place where an engine is taxed so severely as in a planing mill; the sudden starting of a heavy planer and saws strains an engine to its utmost, and if it is not well made and of sufficient power, the result is a "breakdown" and trips to the machine shop, to say nothing of the damage caused by the delay, which is often enough during one year to purchase a good engine. To insure steady motion the driving pulley should be as large as expedient, and a weight of 600 pounds to the inch of cylinder diameter, and the piston should have a speed of 350 to 400 feet per minute.

To find the horse power of an engine, multiply the area of the piston in square inches, by the speed of the piston in feet per minute, and divide the product by 33,000. The result is the horse power value of one pound mean effective pressure, and if multiplied by the whole mean effective pressure, will give the indicated horse power.

FIRE-PROOF STRONG ROOM.—We saw lately, says *Iron*, at the London works of Messrs. Chubb & Son, the largest fire-proof strong room yet made for use by any bank in this country. It is 20 feet by 12, and 9 feet high, and weighs 23 tons. It is divided into three compartments, the first serving as a passage or lobby, in which will stand several iron safes. The next larger is fitted up as a closet designed to contain iron safes on shelves. The largest one is provided with shelves all round, reaching from floor to roof, and intended to hold boxes containing securities, a certain portion being further enclosed for jewels and special valuables. The entire structure is made to take to pieces; but though the number of rivets and screws used is enormous, not one is fastened or is visible from the outside. Not a single butt-joint is used, and no crevice exists where a burglar's tool could be insinuated. An air chamber is provided between the skins, and fireproofing composition is filled in all round, above and below. The roof is fortified by girders, and the outer door is massively constructed of wrought iron and hard steel, weighing nearly a ton, and fastened by two of Chubb's locks, throwing bolts out from all four sides. An inner folding grille is used to ventilate the room by day while the door remains open, and an electric alarm is fitted so that any tampering with the door by night is instantly announced by a bell in the manager's room.

CARBONIC ACID AS A MOTOR.—Herr Beins, of Groningen, Holland, is of the opinion that carbonic acid (which he terms carboleum) will be the long-looked-for successor of steam, as a motive power. He has shown that, when sodium bi-carbonate is heated in a confined space, a portion of its carbonic acid is liberated, under any degree of tension; so that, for example, by heating the bi-carbonate to about 200 or 300 deg. (about 400 to 575 deg. Fah.), liquid carbonic acid is obtained under a pressure of from 50 to 60 atmospheres (750 to 900 pounds). If a more moderate pressure is wished, it is only necessary to moderate the amount of heat applied, so that it is quite within the power of the operator to store up the acid at any desired pressure. The observations of Herr Beins are practical enough to warrant the attention of those who are interested in the matters he discusses. He certainly indicates a cheap and practical method of generating a prodigious amount of energy, the utilization of which is attended with even less difficulties than steam.

SCIENTIFIC PROGRESS.

The Phenomena of Digestion.

Just now medical men in Paris, says the London *Telegraph*, are busy discussing a curious case which has come under the observation of the learned Dr. Verneuil. The doctor had a lad brought to him for treatment at the Hospital de la Pitie, who had swallowed by accident a dose of caustic potash. The terrible escharotic produced so tight a constriction in the gullet that no food could pass down into the stomach. Death from inanition must have been the result had not Dr. Verneuil courageously resolved to perform the dreadful operation known as gastrotomy. On the 26th of July, accordingly, he cut right into the lad's stomach and inserted into it an elastic tube, through which food could be injected. In this way soup, fine-chopped meat, mashed vegetables and drink were administered. On the 10th of September the young man recovered his health and spirits. He was able to go about and help the servants in the hospital, and seemed to have as much life and energy as he had before the accident. Between the 18th of August and the 14th of September he gained 10 pounds in weight, while being fed through the hole in his stomach. Of course this case must have a rare interest for all students of the complex phenomena of digestion, and it cannot but recall a still stranger one, which, nearly 40 years ago, Dr. Beaumont, a Canadian, had the good fortune to observe. His patient enabled physiologists, in fact, to formulate nearly all our existing knowledge of the processes of stomachal digestion. He was one Alexis St Martin by name, and, luckily for science, he had a hole made in his stomach through the sudden discharge of a gun, and Dr. Beaumont cured him so far that he recovered his health; but though the wound healed, the opening remained, and through it Dr. Beaumont was enabled to see the workings of a living human stomach in nearly all conceivable circumstances. Another case of the same sort—that of an Esthonian woman—came under the observations of Drs. Schroeder and Grunewaldt some four and twenty years ago, and vivisectors know how Blondlot and others artificially produced the same condition in dogs, and thereby gained a certain insight into the behavior of food in the ventral alembic of the tissues. It was found, for example, that in the fasting state the walls of the stomach appeared pale and flabby, and lay close together, whereupon some people erroneously concluded that the sensation of hunger was due to the rubbing of the coats of the stomach on each other. It was noted that whenever food was introduced the sides of the cavity reddened with the stimulated circulation and its muscular activity was aroused. As Dr. Beaumont said, from observations made on Alexis St. Martin, the chewed food was churned in the stomach, and carried round and round the course of its curvatures. In this way it was triturated and exposed to the solvent action of the gastric juice which acted on the albuminous and gelatinous substances swallowed, until gradually a milky fluid known as chyme was elaborated. Thus was it found out that we take usually about four hours to digest a dinner; and it was also discovered that different kinds of food vary much in their digestibility—notable, for example, that fats and oil take a long time to digest when introduced into the stomach alone, but are much more speedily got rid of by that organ if eaten with salad or vegetable matters.

Effect of Emotions.

Of all the curious facts observed by students of the phenomena of digestion, however, none was stranger than the extent to which emotions were seen to effect the operations of the stomach. Mental exertions pure and simple did not seem to retard digestion so much as had been conjectured. Yet when associated with deep emotions, or with that fretfulness of mind we call "worry," it appeared to have a baneful influence. As for the fiercer passions, an outbreak of them would sometimes suffice to prevent the stomach even when most vigorous from discharging its functions. Another mysterious phenomena noticed in connection with digestion was the sympathetic influence exercised by the stomach over the secretion of the mouth. This secretion, as is well known, has an important chemical action on certain constituents of food, changing by a sort of fermenting process starchy matters, for instance, into sugar. In Dr. Verneuil's case, whenever food was injected into the stomach of his patient "a flow of saliva in mouth is produced, in the injection of which a motion curiously resembling chewing is remarked." In short, the different parts of the digestive apparatus are so linked together by nervous connections that they "sympathize" with each other, and if one be stimulated the rest are also excited. But, as might be expected, there is no connection apparently between the nervous system of the stomach and the nerves of taste, for it is related of Dr. Verneuil's patient that when the food is put into his stomach, although his mouth fills with saliva, he feels no sense of flavor in the substance with which he is fed. He is only aware if they be hot or cold, and indeed no anchorite could be in a state of more philosophical indifference to the choicest pleasures of the table. The question forces itself on us, will it be a beneficial thing to rescue him from this condition? These are hard times, and savory food is getting dearer and dearer every day. Would not a man who was thus physically insensible to gastronomic luxuries, who cared not a jot what he ate or drank, have an advantage in the battle of life which ought not to be lightly estimated? So long as good digestion waited on appetite, he would be free from the carking care that darkens the soul of the sybarite as he ponders in his mind that most momentous of all questions, what shall I have for dinner to-day? or sits down to his banquet in fear and trembling lest the cook's kitchen science may for once have failed him in its preparation.

Ozone.

In the *Comptes Rendus*, De Carvalho describes an apparatus for ozonizing the unhealthy air of dwelling-rooms; such air is to be passed by means of an aspirator through a tube, in which the silent discharge of a Ruhmkorff's coil takes place; and the author is of the opinion that air subjected to this treatment will be freed from the organic matter suspended therein and its harmful character destroyed. To his paper are appended some remarks by P. Thenard, who says he considers it is high time that not only the public, but learned men should be made acquainted with the erroneous nature of the views generally held respecting the action of ozone on organisms. So far from having a beneficent effect, ozone is one of the most energetic poisons known; and the grave accidents which have happened in his own laboratory do not leave the slightest room for doubt about the matter. While leaving the physiological aspects of the question to M. Arnould Thenard, who has a work on the subject in preparation, he confines himself to stating that under the influence of ozone, even when very largely diluted, the blood corpuscles rapidly cohere, and even change their form, the pulse beats more slowly and in so very marked a degree that in the case of a guinea-pig, where the beats were nominally 148 per minute, they fell to 1-30th after the exposure of the animal for a quarter of an hour. In the present day, when medicine possesses in a knowledge of temperatures so excellent an indication of the stage of a disease, it is possible, he considers, that an agent may be found in ozone for controlling them when too high; to introduce, however, without further consideration, ozone into our rooms with the fallacious notion of thereby destroying bad air, is highly dangerous. While the most powerful poisons, when rightly administered, constitute some of our best remedies, we must first have learnt how to apply them lest we fall into error as regards the right time for application and the strength of the dose. Thenard then asks the question: Are we sure that there is ozone in the air? Its presence in our atmosphere is determined by the change in the depth of color of prepared paper. Do we know that there are no other substances in air which can affect the paper in the same way? By passing a current of air through a gas-blast, Wittman obtained air which acted on prepared paper as ozonized air does; while, however, this air disinfected putrid water without rendering it acid, ozone, so it is stated, did not disinfect it, but turned it acid. Moreover, it is known that ozone cannot exist above 200 degs., and yet the air modified by Wittmann's method had been exposed to the temperature at which glass softens. Although he is not prepared to deny the possible presence of ozone in the atmosphere, he holds it rash to regard as proved what is still vague and uncertain, and, maybe, dangerous. Since the publication of Thenard's paper in January last, this important question has not been solved, and in the presidential address which Dr. Andrews delivered before the British Association last month he states: "the chemist can furnish a simple test of this (unhealthy) state of the atmosphere in the absence of ozone, the active form of oxygen, from the air of our large towns.—*Academy*.

The Carpet Anthrenus.

The *Anthreni* as a genus are well-known pests of museums of natural history the world over. There are numerous species, some half-dozen of which are found in this country, including the well-known *Anthrenus musæorum*, Linn., the great enemy of collections of natural history, especially of stuffed birds, insects and other zoological specimens. But the *Anthrenus lepidus* of Leconte appears to frequent carpets and is particularly destructive to the former.

My first specimen came from Oregon. The next received came from Central New York, where this pest had received the name of "the California carpet moth," probably because some one had recognized it as the same insect which had been found infesting carpets in California, but it is not a moth, but a beetle, and like all the *Anthreni* belonging to the great order of *Coleoptera*, and to the family of *Dermistidæ*.

The larvæ of the *A. lepidus* are small hairy grubs, and change to pupæ within the larval skin, not casting off, as do some other kinds of beetles, the imago or perfect insect emerging from the pupa skin, passing out of the old cast-off shell of the larva at the same time. Any one who will take the trouble to collect a few of the larva, and put them into a glass bottle, with a few shreds of woolen cloth, can observe their transformations.—*Am. Jour. of Microscopy*.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR.

MECHANICS' MINE.—*Dispatch*, Dec. 23: The water is now all out of the shaft of this mine, near Sutter Creek, and the work of sinking is progressing. The shaft is down about 160 feet, and there is a three and a half-foot ledge of splendid rock. The company will soon commence crushing the rock, when its merits will be more positively known. All the present indications are that this will prove a very valuable mine.

FLUME COMPLETED.—The large flume of the Amador canal company, to be used in place of the pipe near New York ranch, has been finished, and the water was turned through it last Sunday. This is a fine piece of work, and presents a beautiful sight for the eye. It is about 60 feet high at its highest point. The flume was substituted for the piping to enable the company to float down wood and timbers. Floating can now be carried up from the large pipe near Clinton down to the lower end of the canal.

MONTGOMERY OAK.—*Ledger*, Dec. 23: A clean-up was made at the Volunteer mill last week. Upwards of 100 tons of rock from the Montgomery mine was put through, yielding close on $1,000, averaging about $8 to the ton. This is regarded as a highly satisfactory yield, inasmuch as the Volunteer mill is not exactly suitable for crushing rock of the Montgomery kind, and considerable gold is lost. The crushing at the Kearsley mill will undoubtedly give a much better percentage of gold, as the mill is better adapted for the kind of rock met with hereabouts. The stockholders feel greatly encouraged, and we expect to see ere long a 40-stamp mill in operation close to the mine.

RICH ROCK.—We have been presented by Captain Beck with a small piece of quartz taken from the Spanish mine, near Mokelumne river, which he is now putting in working shape. The specimen is speckled all over with free gold, and is by long odds the richest ore we have seen for some time. Captain Beck informs us that it is nothing unusual to come across similar pieces of rock. After inspecting samples of ore from this claim one is filled with wonder that such a rich mine has remained comparatively idle for so many years.

NORTH GOVER.—The shaft of this mine is down 100 feet. We understand that arrangements have been made by the company with Knight & Co., of Sutter Creek, for the erection of hoisting works over the shaft.

ALAMEDA.

NEW COAL MINE.—Alameda *Independent*, Dec. 23: The Summit coal mine, about eight miles southeast of Livermore, is found to be more and more valuable the further it is explored. The vein was first discovered last spring, and runs in an east and west direction for a mile and a half, and is about six feet wide. A thousand tons have been taken out by hand and tested in four mills and different factories at Oakland, San Jose and San Francisco, as well as in Livermore and other towns near here, and the quality has given uniform satisfaction. The coal can now be delivered at San Francisco at a cost of $5 per ton, and could be delivered for $3 if there was a railroad from the mine to the present overland railway, and machinery on hand for hoisting the coal. About a hundred or so yards south of this vein, and parallel with it, lies another vein of coal which has not yet been prospected, but looks on the surface as if it were larger than the first mentioned one. To all appearances there seems to be in these hills an abundant supply of a kind of coal that will be in daily increasing demand in this section as well as throughout the whole southern part of our State. It needs the use of capital to be properly developed.

CALAVERAS.

RICH ORE.—Calaveras *Chronicle*, Dec. 23: We have been shown some extraordinary rich specimens of ore taken from the well-known "Greenhorn" mine, at Mosquito gulch, owned by Messrs Rodgers & Potter. The rock, which was taken from the bottom of the shaft 35 feet deep, is thickly flecked with particles of free gold, forming one of the richest and handsomest specimens we ever saw. At the depth of 35 feet the ledge in the Greenhorn is from 12 to 20 inches in width, all high grade ore. The company now have something like 15 tons of immensely rich rock on the dump, and are constantly adding to it. Former crushings of ore from the Greenhorn have invariably paid largely, but the rock now being taken out will reach higher figures than any previously mined.

MINING MOLECULES.—The mill at the Dunyea mine, lately supplied with a new cam-shaft, cams, dies, etc., is again in motion and isn't likely to "hang up" very soon. The tunnel in the Emerson mine, Happy valley, is completed. Lack of lumber prevents the immediate resumption of operations. Moser is running a tunnel to facilitate the opening of his hydraulic on Tunnel ridge. Veith, piping.

ITEMS from the upper country are slightly "attenuated" this week—as few and far between as angelic calls. Chick & Son have lately discovered a promising quartz ledge in the vicinity of the Lone Star mine, West Point. The crushing of rock from the Champion will be finished to-day or to-morrow. Everything is progressing favorably at the Mina Rica.

MINING.—Calaveras *Citizen*, Dec. 23: Treat & Wyllies' claim, on Gaston hill, near Cave City, is now ready and waiting for water. They have two races to wash through, one on the north and the other on the south side of the hill, and during the summer and fall months have run two powder drifts, and charged the one on the north side with 1,000 pounds of powder and the other with 875 pounds, both blasts doing well and blasting the hill, so that when water is turned on they will wash the dirt very fast. In the drift on the north side of the hill, some very good gravel was found and promises to pay well.

EL DORADO.

ANOTHER BONANZA.—*Mountain Democrat*, Dec. 23: At the Griffith Consolidated mine, near Diamond Springs, an immensely rich development was made last Thursday night. At the depth of fifty feet, in an eight-foot ledge of good milling rock, a seam was struck which is about two and a half inches wide, literally a pepper-and-salt conglomerate of rich sulphurets and free gold—fully as much of the latter as of the former. The quartz is a regular ribboned blue and white, and the ledge is strong and well-defined. Mr. Griffith calculates on quarrying out a five thousand dollar slab from the above described rich vein, in fact this object has probably been accomplished by the time this item reaches the eyes of our readers. We shall take a peep at the mine within a few days, when we will give our patrons further information as to its appearance and condition. We have seen some very rich ore which was taken from the shaft nearer the surface, and equally fine samples from other and remote portions of the ledge, both north and south of the shaft. We are very confident that rich developments will be made in that mine under Griffith's energetic management.

INYO.

THE DEFIANCE.—Inyo *Independent*, Dec. 25: We understand that the Defiance furnace, or furnaces, will be started up for a continuous run directly after New Years, and under such favorable conditions as to leave no doubt but the property will pull through its embarrassments, not only on time, but a month or two to spare. To this end Superintendent Reddy is directing all his energies and best judgment, so we have no doubt the result will be just as intimated.

EMIGRANT COMPANY.—*Coso Mining News*: We hear from Mr. Peter Taylor, Superintendent, that the Emigrant company's difficulties have all been satisfactorily adjusted, and that work will at once be recommenced upon their mines. Mr. Taylor arrived here about 10 days ago, and at once commenced paying up accounts held against his company. Mr. Taylor will at once begin the work of sinking to a sufficient depth upon their mines to demonstrate their permanency and whether the quantity of ore to be obtained from them will warrant the erection of a 20-stamp mill instead of the 10 stamp, as first contemplated. The pipe for conducting the water from the Bureau springs to the mines, where the mill will be erected, is now in San Francisco, having arrived from Glasgow, Scotland, some time ago. The work of laying down the pipe, however, will hardly be commenced before spring, as there are places in the mountains where severe frosts will be likely to interfere with the work. Work upon the mines will be actively prosecuted during the winter, the necessary machinery, timbers, lumber, etc., for the mill will be ordered, and, when the spring opens, but a short time will be required to place everything in shape to send out bullion to a large extent.

CERRO GORDO.—The Union is steadily worked along and considerable ore taken out. Only one furnace, however, is in operation, the upper one having been shut down, probably for all winter. The new shaft also is being pushed along and making good headway. Great things are expected of the latter and it is confidently hoped that a large body of ore will be encountered upon striking the ledge. It has cut already some small strata of ledge matter, but no ore has been taken out. After having reached a certain depth quite a distance will have to be drifted to cut the main ledge. The ore extracted for the last year from the old works could certainly not compare favorably with that of former times, either in regard to quality or to quantity. On an average it has been very low grade and scanty.

LAKE.

OAT HILL.—Lake Co. *Bee*: The superintendent of the Oat Hill mine was in Middletown last week hiring miners. The company expect a full force, and the mine in running order by the 15th of next January.

THE AMERICAN mine has recently changed hands; a company from Vallejo has bonded the mine. Mr. Soper is superintendent. At present there are about twenty men at work. On the first of January next the mine will be in working order, when there will be a force of two hundred men.

MARIPOSA.

FROM MARIPOSA TUNNEL.—Mariposa *Gazette*, Dec. 23: In one of our late issues we mentioned that the vein had been struck by the main heading. The good news then published to the people was a mere idea of what was in store—as developments of the past week have shown. The vein has been prospected for some seventy feet in length, and is nowhere less than five feet wide, while for the greater distance its width is from six to seven feet. Assays and "horn" prospects show a goodly amount of free gold. The latter is quite coarse and of good quality. At any rate, developments have induced the company owning this property to immediately begin—put their stamps in order—and appearances indicate that there will be lack of capacity to handle all the rock which they can command. Already from that part of the vein now opened hundreds of tons of good ore can be obtained.

MONO.

MINING CAVE.—Inyo *Independent*, Dec. 23: Some time last week a couple of miners working on the 150-foot level of the Comanche mine, Benton, were shut off from the outer world by an extensive cave of ore between them and the shaft. A strong force was promptly set to work in extricating them, but which could not be accomplished until after they had been most unwilling prisoners for some 18 hours. They were uninjured, however, and used their picks and even giant powder in trying to work out. Another miner met with a fall of 40 feet, and strange enough, got off without a scratch.

NEVADA.

SHULTZ GRAVEL M. Co.—Nevada *Transcript*, Dec. 23: Out on Banner hill, about three miles from this place, a company composed of Virginia City gentlemen are opening a gravel claim. I. W. Duncan is the superintendent. Work was done on the ground about fifteen years since, but on account of the pitch of the bedrock, and the necessity of going deeper, which the company owning it was unable to do for want of funds, the claim was abandoned. Mr. Honsinger, the President of the present company, was one of the original owners, and knowing that there was good ground there, has organized the present company, with a view to open and thoroughly develop the claim. The company is the same as the one that has opened the Centennial mine in Washington township. Work was commenced five weeks since. An incline is being sunk, and is now down about forty feet. It is the purpose of the company to run down until they strike bedrock, when, if the prospect warrants it, machinery will be put up to work the claim on an extensive scale. The gravel was rich when worked originally, and the company feel confident of opening a first-class mine. There is a large body of wine gravel in sight now, through which the incline is being sunk. The members composing the company are men of means, and can command any amount of capital. Although they reside on the Comstock and know of the fabulous treasure contained therein, they think there is a good field for the investment of capital in Nevada county, as is shown by their purchase and development of two mines in our midst. They are the kind of men needed in the county, and our residents gladly welcome them to their midst. Capitalists elsewhere will, after a while, learn that a better section for mining does not exist on the coast. There is room and opportunity for all of them.

PLACER.

MINING ITEMS.—Dutch Flat *Forum*, Dec. 23: The Elmore Hill, Southern Cross and Polar Star claims continue washing a few hours only each day. The Summerset claim is washing nights only. The Franklin claim is about ready for the first rains, having nearly cleared the tunnels and sluices of the debris occasioned by the powder blast of last week. The Baker claim is still being worked with vigor. One of the powder drifts is nearly completed and a blast will be exploded therein in a few days. The Lakamp claim is now washing a few hours each day.

REMINGTON HILL MINES.—Rhode Island Co. have finished cleaning up, and it is said to have paid well. As the weather remains good for outside work they have concluded to continue ground sluicing until the storms drive them into their drift diggings.

The Wide West Co. are busily engaged laying in a winter's supply of drifting timbers and wood. They are also advancing a side drift across the channel, where an air shaft will be raised, and at which point side drifts will be opened and the ground breasted out in large blocks to the main tunnel. This mine is looking splendid, the gravel in places prospecting as high as two dollars to the pan.

LOWELL HILL MINES.—In the Swamp Angel the main tunnel running east across the channel has been advanced 700 feet through gravel, and as yet there is no signs of rim rock, thus showing it to be very extensive. The breasting out of the large block of ground north of the main tunnel has been somewhat delayed of late, owing to bad air. To remedy this a drift is being run west 180 feet, to connect it with old drift diggings, where a good supply of air can be had; it is being run by four hour shifts and will be completed in three days. Having a very large supply of drifting timbers, lagging, wood, etc., on hand, and the prospects improving as they advance their drifts, this claim may be classed as one of the most prosperous mines in this vicinity. The Wild Cat Co. are hard at work running their bedrock tunnel. Wilkinson Co. will commence work again in a few days. The Fowler Bros., owning 1,000 feet of ground east and adjoining Wilkinson Co., tapped a channel through a bedrock tunnel at a distance of 200 feet, but as the rock dipped heavy into the hill this tunnel has been abandoned. Another will be run considerable lower. Lavey Co. are advancing their bedrock tunnel.

LIBERTY HILL MINES.—Liberty Hill Co. turned on and began washing again last Monday. They are using 1,600 inches of water and working seventeen men. Having a large amount of gravel, shaken up by a recent blast, the work is progressing rapidly and favorably.

SIERRA.

IOWA.—*Mountain Messenger*, Dec. 23: The Iowa company are not quite down with their shaft yet, but will be in a short time, no accident preventing. They have been delayed some by water, etc., but still are progressing fairly.

SISKIYOU.

THE KLAMATH RIVER CLAIMS.—Yreka *Union*, Dec. 23: From parties from Scott Bar we learn that Kettlewood & Co., having worked out all the ground enclosed by their dam, have taken their wheels and machinery out of the river. Within a couple of feet of their head dam they got a splendid prospect, but could not work it this season as it would undermine their dam. They therefore built a dam on it some 24 feet wide at the bottom and 16 feet at the top, to prevent the dirt washing away when the water raises, and will work it next season. Bean & Co. are still working, though they have not taken out much lately. From Mr. Bean we learn that a few days ago they struck a rich prospect again, and he expected that they soon would take out big pay again. He says he would not be surprised if they were able to work all winter now. They got on to a very rich streak soon after they got the claim opened, but shortly after came on to a patch of flat smooth bedrock, which of course would hold no gold. Mr. Bean thinks they have now got over this patch, and expects to strike the rich streak again every day.

GOT A GOOD PROSPECT.—We learn that some men who recently commenced operating an old claim on French bar, on Scott river, struck a fine prospect last week. They took out about $200 in one day. Among it was a nugget which weighed nearly $100. This is highly encouraging, and the party will continue opening the claim, feeling confident that such prospects show plainly that there is something in it.

SCOTT BAR DITCH.—We learn that the S. J. M. M. & D. Co. are making splendid progress with their ditch to take water on to Scott Bar. It is expected that it will be completed to the Bar before long. This ditch will open a large quantity of mining ground and will furnish water to work many claims besides those that the company will work itself. There are many other places in this county which if outside capital would come and put water on would pay largely both the company that builds the ditches and other parties who would buy water of them.

THE EVENING STAR MINE, owing to the freezing up of the water has had to shut down for a week or two. From parties who have lately visited this mine we learn that it still turns out its usual dividend to its lucky owners, and that its permanency as a first-class mine is now beyond a doubt. The ledge, in the tunnel now being worked, is 10 feet wide, and above the tunnel it widens out to 16 or 13 feet. It is a fine solid body of ore with perfect casings and foot walls, and there is enough now in sight to supply the mill for at least four years steady crushing. The rock is of fine color and the pay is very equally distributed. Of course there are some spots which are richer than others, but it is all good for an average of $10 per ton, which about all the ore taken out of this mine thus far has averaged. In the spring, or as soon as the present tunnel is run through the ore body, the owners contemplate sinking a winze in the center down on the ledge to the depth of about 160 feet. A tunnel will then be run in from the face of the hill to tap this winze or shaft. Parties who know say that enough ore can be easily taken out of the mine to run a 12-stamp mill all the year round. The owners contemplate before a great while to make an addition to their milling facilities, as their water privileges furnish them with water enough to run eight stamps most of the year, and the rest of the year they have water enough for an eight-stamp battery and a steam engine. This mine is generally thought to be one of the best pieces of quartz property in the northern part of the State, and as the owners seem to be very well satisfied, they no doubt think so too.

SONOMA.

ITEMS.—*Russian River Flag*, Dec. 21: The Fall claim, Thos. Armstrong superintendent, is being worked. The Bacon mine has a force of men getting out ore; it is expected that Eames furnaces will soon be erected. M. D. Haskings improvements to the 10 ton Eames at the Great Eastern enables the company to turn out three to five flasks of mercury per day. Twenty men are at work at the mine. Mt. Jackson mine has shipped 21 flasks of quicksilver this week. J. S. Shaffer came in from the Mt. Jackson mine this week, and from him we learn that the three furnaces are all now running uninterruptedly.

TUOLUMNE.

TUNNEL.—Tuolumne *Independent*, Dec. 23: A San Francisco company, represented by a practical miner, Mr. Graham, formerly of Mariposa, is about to sink a shaft near the Shaw's Flat road, among the boulders. An overshot water wheel, for pumping and hoisting purposes, will be erected, and a shaft will be sunk for the purpose of "bottoming the boulders," or at least to ascertain the practicability of running a tunnel from Dragoon gulch.

VERY little snow has fallen this winter in the mountains—except during our first rain, which soon melted away. Hunters report not a particle of snow between here and Aurora.

SOULSBY.—We understand that two Burleigh drills are to be put in operation in this mine before long.

Nevada.

WASHOE DISTRICT.

JUSTICE.—Gold Hill *News*, Dec. 27: Daily yield, 330 tons of ore, keeping the mills all steadily running, and laying up a reserve of from 30 to 40 tons of ore per day for use in case of storms or bad roads. Another mill is to be added to the crushing capacities of the mine. The yield of bullion for December will be considerably in excess of that for November, the amount of ore crushed paying much more per ton than it has any time in the past.

CON. VIRGINIA.—Daily yield, 200 tons of ore. Repairing and enlarging the drifts connecting the Gould & Curry shaft with the mine is being pushed with the usual vigor. It will take from ten days to two weeks yet to finish that portion of the work. Nearly three days' time have been consumed during the week in repairing the main drift east at the 1350-ft station, almost entirely cutting off the extraction of ore during that time. No work has been done on the 1700-ft level during the week, on account of the intense heat in that portion of the mine.

YELLOW JACKET.—The east cross-cut from the north winze 45 feet below the 1740-ft level is steadily advancing to the eastward, the face in quartz and favorable ledge formation. An east cross-cut has been started near the north line on the 1940-ft level.

CALIFORNIA.—Daily yield, 500 tons of ore, keeping the mills all running up to their full crushing capacities. The yield of bullion for December will not vary much from that of November. The ore breasts show little or no change. The face of the prospecting drift south on the 1600-ft level is still in good ore. The main west drift on the 1650-ft level from the C. & C. shaft is steadily advancing, the face in rock somewhat harder than at last report.

BALTIMORE AND AMERICAN FLAT.—The upraise on the 650-ft level is pushed ahead, the face following the small vein of ore, which continues of an encouraging character.

NORTH CON. VIRGINIA.—The mine was never in as fine a condition for active development as at present. The new pumps are doing excellent work. Sinking the main shaft is being pushed forward with all possible vigor.

BULLION.—The south drift on the 1500-ft level is still in very favorable ground. The main north drift, on the 2000-ft level in the Alpha ground, is making rapid headway, the face still in porphyry mixed with streaks of quartz.

JULIA.—The west cross-cut from the main south drift on the 1800-ft level is steadily advancing, the face still in quartz and porphyry mixed. The ledge is showing large, well-defined and greatly improved in character on this level.

OPHIR.—Daily yield, 200 tons of ore. The ore breasts on the 1600 and 1650-ft levels show no change. The north drift on the 1700-ft level is showing very favorable ore indications, and the entire prospects of the 1700-ft level are looking more encouraging.

OVERMAN.—The main south drift on the 1200-ft level is steadily advancing toward the Caledonia line, to connect with the north drift from the Caledonia shaft. The station has been completed at the 1400-ft level, and a drift is being pushed rapidly toward the ledge.

NIAGARA.—A station has been opened at a depth of 480 feet in the main incline and a drift started parallel with the ledge.

LADY WASHINGTON.—The drift north from the main east cross-cut is to-day in 52 feet. The whole face is now in quartz, showing good streaks and bunches of ore.

PROSPECT.—Very good progress is being made drifting west at the 400-ft level. The drift is now in 270 feet, and the face is at present in splendid looking vein matter.

ERIE CON.—This mine has settled its financial difficulties, and has been again started into full operation under very favorable circumstances. The location is a good one, and, if well worked, bids fair to develop a good paying mine.

SAVAGE.—A heavy lift pump is being lowered to the 1000-ft station. This pump will be ready to start into full operation in a day or two more.

CALEDONIA.—The bottom of the shaft encountred much softer ground during the past week, carrying a considerable amount of quartz of a very favorable description.

GOULD & CURRY.—The east drift on the 1700-ft level is being put in good repair for more active use.

SIERRA NEVADA.—The prospecting drifts north and south on the 1700-ft level are making steady headway, the face of each in very favorable ground.

HALE & NORCROSS.—The pumps are kept steadily running. The flow of water shows a steady weakening. The cave in the main incline is nearly repaired.

SILVER HILL.—The north drift on the 414-ft level is steadily approaching the south line of the Justice, the face still in very favorable ledge material.

LEVIATHAN.—Cross-cut No. 3, at the 600-ft level, is now in the ore vein, and good assays are obtained from the face.

NORTH CARSON.—The ore prospects at the lowest or 500-ft level are excellent, but further development at that point is discontinued for the present.

CHOLLAR-POTOSI.—Sinking the main incline is progressing two and a half feet per day. Sinking the combination shaft is going steadily forward.

FLORIDA.—Sinking the shaft is making the best of progress, the bottom being in porphyry, mixed with clay and stringers of quartz of a very lively and healthy character.

WARD.—The southeast drift on the 1600-ft level of the Julia, to tap the Ward shaft, is being pushed forward with all the force that can be used.

SUCCOR.—Owing to some unavoidable delays in regard to the machinery the new pumping machinery has not been put into full operation.

UTAH.—Sinking the shaft is making fair progress. The rock in the bottom is very firm, but blasts well.

BUCKEYE.—The north drift on the 350-ft level is showing some very fine ore prospects.

CABINET.—Bottom of new shaft in good looking ledge porphyry, with streaks of quartz and clay.

DAYTON.—The prospecting drifts north and south on both the 600 and 700-ft levels are making the usual excellent progress.

KOSSUTH.—The prospecting drifts on both the 600 and 500-ft levels are making the best of progress, with steadily increasing ore prospects at every point.

NEW YORK.—The enlargement of the pumping compartment of the shaft is being pushed to completion.

COSMOPOLITAN.—Ore extraction and development work generally going ahead well.

WEST BELCHER.—The 300-ft level is showing excellently in good pay ore.

SUTRO TUNNEL.—Material in face of header hard porphyry, with seams of quartz and clay. Total length of tunnel, 14,448 feet.

TROJAN.—The ore developments on the 300-ft level continue of a very fine character.

LADY BRYAN.—All the machinery is on the ground, and good progress is being made with its erection.

BULLION DISTRICT.

ORE.—*Silver State*, Dec. 20: It is customary to get bullion from ore, but Charley Twiss changed the order of things by bringing a carload of ore from Bullion—that is Bullion district—to the Humboldt reduction works yesterday. The ore is from the Centennial mine, on which Mr Twiss has been working for some time past. Bullion district is situated in the range of mountains east of Battle Mountain, and we learn that there are three or four mining companies at work there.

EUREKA DISTRICT.

ADDITIONAL WATER JACKETS.—Eureka *Sentinel*, Dec. 22: The Richmond company is receiving the necessary machinery and appliances for additional water-jacket furnaces. One of them will have a capacity of 100 tons per day, which necessarily makes it a mammoth concern. The tests made by the Richmond with water-jacket furnaces have proven eminently satisfactory.

K K.—All accounts agree that the K K has a mammoth body of ore. It extends from the second to the seventh level, and is of great width. The K K is certainly a valuable property, and the only wonder is that the stock is not selling for more money.

HUNTER DISTRICT.

ENCOURAGING.—Eureka *Sentinel*, Dec. 21: This district is situated in the eastern portion of White Pine county, not far from Ward. Reports from there of late are very encouraging, and it is thought that next season it will rank as a very prosperous camp. Cherry Creek, Ward and Hunter, these three districts promise to do much in the near future towards bringing old White Pine again to the front. The big tunnel into Treasure mountain, being run by the Eberhardt and Aurora company, is also another favorable omen for that section of the great east. Taken all through, the prospects of our neighboring county appear brighter now than for years past.

INDIAN DISTRICT.

WORK RESUMED.—*Silver State*, Dec. 20: We learn that operations have been resumed on the Eagle mine, Indian district, south of Unionville, by a New York company, which has leased or purchased the property. There is a new 15-stamp mill on the mine, built by the Oakland gold and silver mining company. The property is believed to be valuable, and with good management will soon be paying dividends. We have been

Case-Bearing Moths.

Description of a New Californian Species.

The following paper on the case-bearing moths (*Psychidæ*) with reference to the Californian species, was read at a recent meeting of the California Academy of Sciences by Henry Edwards, Esq. We have prepared engravings of the case and larvæ, which are herewith presented:

Among the whole of the insect races, perhaps there are no more curious and interesting examples than are to be found in the family *Psychidæ*, the species of which, in the early stages of their growth, weave habitations for the caterpillars of fragments of stick, bark, lichens and other vegetable substances, carrying these singular structures about with them .through the whole of their larval stage, and in the case of the female, arriving at maturity, bringing forth her eggs, and eventually dying without once quitting her self-constructed prison. The *Psychidæ* are a portion of the great silk-spinning family of the *Bombycidæ*, but present many characters which are distinct in themselves, and entitle them to rank, as they are now by most entomologists allowed to do, as a separate and well defined tribe.

Though containing comparatively few genera and species they have a wide geographical distribution; examples of the group are to be found in Europe, North and South America, West Indies, Mexico, Ceylon, Northern India, China, South Sea islands, and Australia, being most abundant in the sub-tropical regions of the globe. Many of the species are, however, small in size, and it is possible that a very large number yet await the industry of observers.

In the construction of the caterpillar cases, they manifest wonderful ingenuity, and their houses are even more remarkable than those of the well known caddis-flies among the *Neuroptera*. Pieces of bark, leaves, straws cut to a uniform length, twigs, mosses, lichens and grass, form, among the various species, the outer covering or decoration of the home, while the interior is lined with dense, soft silk, the threads of which are also used to bind together the external fragments. Almost as soon as the larva is hatched from the egg, it begins the formation of its case, never quitting its habitation as it enlarges in size, but splitting it at the sides, weaving into the opening portions of the vegetable matter chosen and adding to the exterior larger pieces of stick, straw or leaves, as the case may be. "While the creature is small, and the house of no great weight, it is carried nearly upright, but when it attains size and consequent weight, it lies flat, and is dragged along in that attitude." The abdominal legs are furnished with a series of strong hooks, by which the larva retains so firm a hold of the interior of its tube that it is impossible to remove it without injury. When feeding, only the head and the first three or four segments are protruded, and if the caterpillar wishes to remain quiet, it fastens itself by strong silken threads to the branch on which it may chance to be; these threads, on a desire for removal, being bitten off close to the case.

It has the power of turning round inside of its case, and when full grown, and about to change to the chrysalis state, it places its head downward, so that when the perfect insect is ready to emerge, it may do so from the posterior portion of the tube. And it may here be said that it is the male alone which escapes from its curious habitation. The female is, in most of the genera, totally unprovided with legs or wings, and is little more than a living bag of eggs, looking, as one author has said, "more like a grub than a moth, the head, thorax and abdomen being hardly distinguishable from each other." Her eggs are laid within the body of the tube, after which operation she dies, the first occupation of the young caterpillars being to consume the body of their mother, "a proceeding almost exceptional in the lepidopterous insects." Having done this, they leave their early home and go forth into the world to follow independent lives.

The males emerge from the chrysalis state in about three weeks, and are dull-looking moths of dark color, generally unattractive in appearance, having the antennæ in some cases deeply pectinated only at the base, and in others, feathered throughout the whole length. They are remarkably swift in their flight, dashing themselves, in search of the females, wildly among the branches of the trees, and as their wings are delicate in structure, in many species nearly transparent, specimens in good order are very rare in collections.

The typical genus *Psyche* is mostly confined to the old world, some 40 species being there known to naturalists. The most striking examples of the group, however, in which the larva case are sometimes four or five inches in length, belong to a genus named *Œceticus*, of which a species named *Œceticus Saundersii* is found abundantly in the West Indies, feeding upon fruit trees, and at times causing considerable damage. A closely allied form is common in Sinaloa, Mexico, some of the tubes of which, together with about 16 species of *Psychidæ* from various portions of the globe, I have the opportunity of exhibiting this evening. I have, however, in my collection, many of the cases, the perfect insects of which are unknown to me, and I may here mention that in confinement it is, from some cause or other, almost impossible to bring these creatures to maturity. During my residence in Australia, one species which, in its caterpillar state, was common upon the *Leptospermum lanigerum* (the tea-tree of the colonists), though persistently collected through several years and watched with incessant care, never reached the perfect stage, and to this day the imago is unknown to me. Nor was this due to the attacks of parasitic insects, as the substantial and somewhat formidable looking houses of the larva rendered them almost impervious to the onslaughts of ichneumons and other insect enemies. Death usually occurred after the caterpillar had undergone its change, the chrysalis gradually drying up after assuming its proper form, nor could any care and attention which I was able to bestow avert this misfortune.

Owing to the resemblance which exists between these remarkable insects and the fasces which were borne before the dignitaries of ancient Rome, one species has been termed the lictor-moth, while others are known as house-builders, sack-bearers, basket-carriers, and like appellations. According to the Rev. J. G. Wood, "the Singalese call them by a name which signifies billets of wood, believing that the insects were once human beings who stole firewood while on earth, and are forced to undergo an appropriate punishment while in the insect state."

The species at present described as natives of the United States are very few, not more than five, belonging to perhaps as many genera, being distinctly known to entomologists. The most common of these is a species called

Cases of Œceticus Davidsonii, attached to the Stem.

1, 2. Chrysalis, removed from its case.

Thyridopteryx ephemeriformis, which, according to Dr. Harris, is occasionally abundant in Philadelphia and its vicinity, and there popularly known in its larval state as the drop-worm, or basket-worm. It is at times very destructive to the arbor-vitæ, larch and hemlock trees. In California, though none as yet have been described, three species are known to me, two of which belong to the typical genus, *Psyche*; the third, and by far the most interesting, which has just been discovered by our President, Prof. Davidson, representing the genus *Œceticus*. It is, however, a matter of regret that at present the caterpillar cases of these three species are alone known, the perfect insects as yet evading our discovery.

Though, perhaps, not quite in order to give names to insects from their earlier stages alone, I am induced to offer brief descriptions of these curious creatures and to suggest the names appended to them, in the hope that I may, by directing attention to the subject, induce observers in various portions of the State to devote their energies to the discovery, not only of the more mature conditions of the species already imperfectly known to us, but to the detection of other forms of these most interesting insects.

Psyche fragmentella. Hy. Edw. n. sp.

Chrysalis case about an inch in length, tapering gradually to its posterior extremity, and composed externally of portions of leaves and bark, mostly ovate in shape, and from one to two lines in greatest diameter, in most cases laid flat on the silken web, and not overlapping each other. Chrysalis pale tawny, shining, smooth, of uniform thickness throughout.

Length, 0.40 inch.

On trunks of pine trees, Strawberry valley, Siskiyou county. Hy. Edw.

Psyche coniferella. Hy. Edw. n. sp.

Chrysalis case a little over an inch in length, thickened anteriorly and composed of fragments of the leaves of pine, about three lines in length, laid in rows upon the silken web, and overlapping each other, in the manner of *P. graminella* and other European species. The fragments diminish in length on the posterior layers.

Grass Valley, Cal. On palings and trunks of pine trees. Hy. Edw.

Œceticus Davidsonii. Hy. Edw. n. sp. (See engraving.)

Chrysalis case about one and a half to one and three-fourth inches in length; stout, a little thickened in the middle, and composed of pieces of sticks or twigs from one-third to one and a quarter inches in length, laid side by side longitudinally, one or two pieces nearly always extending posteriorly some distance beyond the termination of the case. The fragments with which the case is covered are of different lengths, and are about 15 in number, the interstices being filled with wood dust (most probably produced by the jaws of the insect itself,) closely woven into the silken groundwork of the case. The edges of the pieces of wood are always neatly rounded by the insect, and all outstanding branches are bitten off. Chrysalis, with the abdominal portions, light chestnut brown, with the wing cases almost black. It is nearly tubular in form, smooth, with some small hooks on the abdominal segments.

Length, 0.65 inches.

Discovered by Prof. Geo. Davidson on Mt. Diablo, on the branches of *Castaneopsis chrysophylla*, Dougl., (chinquapin chestnut.) I have much pleasure in recording this interesting discovery by attaching to the species the name of our respected President.

It will be observed, both in the present species, and one closely allied to it from Australia, that there are, as I have showed, in most of the cases, some pieces of twigs longer posteriorly than those of which the remainder of the case is composed. It has struck me that these may be intended as a means to assist the male insect, or arriving at the perfect state, to escape from the body of the tube, the twig affording foothold and enabling the creature to draw its somewhat unusually long abdomen from the aperture. I do not state this as a fact, but the subject is worth the observation of those who may be fortunate enough to have the opportunity. I suspect that the cases containing males only have these lengthened sticks, but if this be so, we are utterly at a loss to understand the process by which the creature arrives during the caterpillar stage, at a knowledge of its sex, and so frames its habitation accordingly.

The Engineer.

The Latest from the Jetties.

The New Orleans *Picayune* gives the following information concerning the jetties. It says: We learn that for some time past the channel between the jetties, at the mouth of South Pass, is everywhere more than 200 feet wide for a depth of 20 feet at average floodtide, and that in the middle of this wide channel the depth is more than 22 feet. This is equal to from 22½ to 23 feet at the highest tide at South Pass, when a range of three feet tide, with a channel depth of 19½ feet, for from 80 to 100 feet in width is usually reported at Southwest Pass. Therefore, it is seen that the jetties have given, though yet in an incomplete state, a magnificent channel across the South Pass bar to sea, twice as wide and several feet deeper than has ever been obtained across the Southwest Pass bar. If this is considered as any indication of a failure of the jetty system, then we should welcome all such failures; they are what we should pray for earnestly. All through South Pass, from its head to the jettied channel over the bar, as is generally known, the depth exceeds 30 feet for more than 200 feet in width.

We are informed that the works required to confine the flow of water from the main river, above the common head of the passes, into South Pass, so as to secure a like deep channel entrance to South Pass over the river middle-ground shoal above its head, are being energetically prosecuted, with every prospect of early success. Already, notwithstanding the low stage of the river, the one-dipper dredge boat at work there to expedite the cutting out of a deep channel entrance, has succeeded, as we are assured, in obtaining a depth of inlet of from 20 to 22 feet across this shoal, which the tidal current suffices to maintain and widen. Soon, we are told, two more powerful dredges will be put to work there, and, with three boats working together, an entrance channel across this hard sand middle-ground shoal, of sufficient width and depth for the largest class of ocean steamers, even at the present low river stage may be expected at an early date. With the river at the hight it was three months ago, we would have even now a clear and unobstructed channel of more than 22 feet in depth, from New Orleans to the sea, through South Pass.

The Work of the Engineer.

At the opening of the Edinburgh university addresses were delivered by the respective professors. In the class of civil engineering, Prof. Fleming Jenkin made some remarks in regard to the aims of the profession, and the spirit in which they should be pursued. He defined the work of the engineer as the application of science to the satisfaction of man's material wants, and claimed that every exact science—by which he meant every science the results of which could be numerically expressed—required for its practical application the assistance of the engineer; and if the historical sciences were less exclusively their own than those that deal with numbers, yet, wherever any science whatsoever was concerned with production or distribution, the engineer could not be repelled as an intruder. No man, he submitted, who loved exact knowledge, could fail to find scope for the exercise of his intellect in the practice of the engineer, and that practice, moreover, was curiously suited to men of the most opposite temperament. Two conditions, and these only, were needed. The man must love his work, and have ability to perform it. In answering the question, whether the engineer may find in the exercise of his profession the solid pleasure of believing that he is working for the general good, Prof. Jenkin said: "By our work we feed mankind, we clothe mankind, we house mankind; through our work deserts are peopled, and old countries teem with a new life. We promote wealth, which, in its simplest sense, is but well-being. Let who will look backward on a past golden age, enveloped by a haze permitting imagination to people its pastures with idyllic beings; we face the present with faith in a future molded by knowledge of the truth. If the husbandman does well, producing food, the engineer, doubling that food, does better. When the engineer cheapens cloth he betters the condition of man more than if he halved his cloak with a beggar. To cheapen dwellings is better than to build an almshouse. I almost relinquish speak of the more direct benefits he confers by giving pure water, fresh air and cleanliness to the dwellers in towns. The direct action of the sanitary engineer is more visible, but is not really more beneficial than the work of all other branches of the profession. The man who, by a better form of bearing, diminishes friction, thereby cheapens production and clothes the poor. We miss the direct sense of alleviated suffering which must be the physician's chief reward, but yet our steamers fetch his drugs and our mills prepare them. The arts which are concerned in the production of beauty are all, save one, strangers to us, and even though the province of architecture is our natural heritage, we have failed to claim our right. Lastly, I believe that I am making no idle boast when I claim that if we, as engineers, labor diligently in our vocation, whether our opportunities be great or small, we shall not labor in vain."

French Engineering.—The project of a great maritime canal between the English channel and the Mediterranean is being more and more considered in France. The delegates of chambers of commerce have, it appears, formed themselves into a commission to promote its execution, and have explained the project to various members of the national government. The Minister of Finance asked for a sketch of the necessary works and the cost, and the Minister of Public Works has acknowledged the advantage of a canal serving for vessels of 250 or 300 tons. It seems that, in regard to the financial aspect of this undertaking, the commission, adopting the estimates of the most reliable engineers, put the cost at some 65,000,000 francs, or about $13,000,000, of which $3,000,000 will be expended on the Seine and the Yonne, $2,000,000 on the Burgundy canal, and the remainder on the Rhone, these being of course the approximate amounts. The depth would be 13½ meters on the Rhone and two meters elsewhere. The locks would be uniformly 133 meters long and 12 broad on the canals. Transshipment would in any case be necessary only at Lyons. As to the length of time required for such a work, the engineers' estimate is six years, provided no unusual difficulties present themselves.

A Chance for Railway Builders.—The *Railway Age* says: American railway builders who are out of a job at home may find it profitable to take a look into the southern hemisphere. The fever for railway enterprises has broken out in the Australian colonies, and several of the colonial governments are taking a direct interest in some of them. The South Australian government proposes to build seven lines, with an aggregate length of about 400 miles, at a cost of $10,000,000. New Zealand proposes to borrow six and a quarter millions for a similar purpose, and Tasmania and Victoria are discussing legislation in aid of railways. The entire mileage of railway in existence in all the vast countries of Australasia at the close of last year was as follows: New South Wales, 459; Queensland, 368; Victoria, 674; South Australia, 274; Western Australia, 50; Tasmania, 45; New Zealand, 257; Tahiti, 21: total, 2,148, or about as many miles as have already been built in the frontier State of Minnesota. If any one will take the atlas and get an idea of the enormous area of these southern lands, and the possibilities for development which await them, he will see that there is an excellent method in the madness, as some might call it, in these regards of the Australasians.

The Northern Pacific.

The *Rollway Age* says: The directors of the Northern Pacific railroad do not seem to have lost faith in their enterprise, notwithstanding the cloud under which it rests. Mr. Stark, the vice-president, who has recently returned from a journey across the entire line, states that much of the country between Fargo and Bismarck, from the Red River of the North to the Missouri, the present terminus, is in good forming land; and although that beyond, in Dakota and Montana, is generally treeless and dry, he thinks that by irrigation it can be made good grazing land. Heretofore only the Minnesota division has been operated during the winter, the Dakota division of 200 miles having been abandoned on account of the driving snow storms, the intense cold and the lack of sufficient business. The receipts of that division, however, having increased during the summer to about $12,000 per mile, and the war department being desirous of keeping communications open, the railroad company will make the effort to run their trains—doubtless to the great joy of the settlers along that dreary 200 miles to whom the absence of the locomotive through the whole bleak winter must be a great privation. From Bismarck it is expected to run stages to Deadwood City, in the Black hills, whether there still seems to be a flow of sanguine gold hunters. The Government grant to the Northern Pacific railroad company, under which 555 miles of the proposed 2,000 have been built, has about two years to run, but the company hope to obtain an extension of eight years, which, considering the formidable character of the enterprise, does not seem unreasonable.

SHIP CANAL NEAR THE GULF OF MEXICO.—The Austin *Statesman* says: The most intelligent citizens of New Orleans, and of cities along the Mississippi and its tributaries, have organized a chartered corporation with a capital of $5,000,000, for the purpose of excavating a slack-water ship canal from New Orleans itself to deep water in Barrataria bay. The boats that have preyed upon New Orleans commerce till commerce died of the plague will themselves be no more. Galveston and cities along the southern coast of Texas would be enriched by this ship canal, which lessens the commercial distance between New Orleans and Galveston nearly one-half, and for the reason that it would lessen the cost of traversing this distance in sailing vessels more than half. But the great and effected would be discovered in the reversal of the commercial map of the South. Trade and traffic and travel from the Ohio and Missouri, and the whole wealth of the country on either side of the Mississippi, the very day that Cowdon's slack-water canal may be opened, would be turned south from the east. The new and the old northwest would alike come down the river and down the railways across Arkansas and Texas to find access to Europe, the West Indies, South America and Mexico, through Southern seaports, and through these would the South receive the products and merchandise of the exterior world. It is a splendid vision of a magnificent future.

GAS WELL.—The new gas well at Beaver Falls, Pa., has been cased 805 feet with 10-inch casing, and 405 with eight-inch. A splendid stream of salt water has been reached, which yields a very fine quality of salt, one gallon of water producing one quart of salt.

New Gold Diggings.

Barney Hughes, the well-known prospector of Montana, John R. Murphy, the first sheriff of Sweetwater county, Wyo., and Henry Lovwell, a noted prospector, have found ten dollor diggings on the head of Big Wind river, 15 miles south of the United States Government graded wagon road which leads from Camp Brown to the Yellowstone national park. The diggings are 120 miles from Lander city, and about 150 from Franklin, Idaho, the terminus of the Utah Northern railroad; and the camp of the finders is about the southern boundry of the park, at the eastern base of the Two Ocean pass. The discoverers report an abundance of gold everywhere throughout a basin 30 miles in extent. The only drawback is the depth to bedrock. The formation of the country is granite, black slate and porphyry, with basins of washed deposit. There is abundance of water, grass game and fish. Grizzlies are numerous, and the buffalo winter in that vicinity. The discoverers are men who have panned out their barrels of gold in the West, and are not horseback prospectors, but dismount camp for weeks and sink holes most industriously. The Wind river valley, as near the camp as Bear buttes, just east of Bull lake, is a fine agricultural country, and the river bottom is not simply fringed with trees like most Western streams, but is heavily timbered. The camp is called "Rawacaboo."—*Montana Herald.*

A FALL of meteoric stones took place near Stalldalen, in Sweden, June 28th, between 11 and 12 A. M. Twelve fragments have been found, one of which weighs four and one-half pounds. A spectator affirms that a very intense whistling was heard, accompanied by a light which was very distinct, though the day was clear and cloudless. Two very loud explosions were heard, [succeeded by one less violent, after which eight or ten persons saw the meteorites fall.

Useful Information.

Hints for the Apprentice.

No workman who receives compensation for his services has a right to forget how to do that which he has been shown how to do; nor is workman working for wages has a right to do anything without thinking about what he is doing, and to think out why or the reason for the way he does it. The habit of forgetting is a bad habit; working without thought is a bad habit; and bad habits in the use of tools are common. It is a bad habit to follow, this striking at a nail with a hammer and missing it; cushioning the blow on your thumb, not so particularly bad on account of the thumb, but it is a waste of blows. Striking at a chipping-chisel and missing it, allowing the mechanical energy stored up in the hammer to expend itself on your hand is not good policy, as it is a loss of time; and striking over the chisel so that the blow is received from the handle is not good practice, as that part of the handle "is not worth a cent" to drive chipping chisels; and besides, handles are limited in their endurance, and to keep up the repairs is costly. In forging, all the blows, of either hammer or sledge, that stop on the anvil do not perform useful work. Using the middle of the file only, when it is made to cut the whole length, using a new file to clean castings, and using a file to do rough work, are bad habits. Using a chisel, lathe or planer tool, or any tool that can be ground, dull, when there is a grindstone running near by, is not the best thing to do; and leaving your tools lying around anywhere, your machine unclesued, the benches in confusion, is a shockingly bad habit.

It is a bad habit to do anything without thinking why you do it that way. If told to do a thing in a certain way, do it as you are told; but, while doing it, think out why you do it in that way. If by the time you have it done you are not satisfied as to why it is done in that way, ask why. If you are given a job and not told how to do it, think out "how and why." There are usually two or more ways to do any piece of work; if one way is better than another there are good reasons to be found for it.

This bad habit of centering a piece and forgetting to see whether it was true, putting it in the lathe and forgetting to drill and countersink the centers, commencing to turn and forgetting to square up the ends, commencing to turn and forgetting to take into consideration whether the piece is large or small, iron or steel; forgetting to set your lathe running faster as your piece grows smaller; strapping a piece on the planer and forgetting to pack it up so as not to spring it, planing down the side and forgetting to turn the tool-post over sideways; trying to make a finished job and forgetting to file off the scale on the corners of a casting; cutting screws and forgetting to oil the dies; running your milling machine and forgetting to oil the cutters; drilling and forgetting to center the drill first; running your machinery all day and forgetting to clean and oil the slides and bearings; all these things are every-day reminders of forgetfulness, but still this is a habit less excuseable than that of working without thinking. Another common specimen of bad habits is the screwing up of every bolt or nut as tight as it can be turned, whether it is necessary or not; when, by thinking what you are about, many times you would see that a single turn of the wrench was sufficient. If we would put a little less tension on our bolts and nuts, and a little more on our thinking and reasoning powers and memory, we would have fewer bad habits and it would be better for us.—*Prof. J. E Sweet.*

Relation of Oil to Power.

The function of an oil when used to lubricate is to lessen friction, and the more perfectly that it is done the more thoroughly is its purpose accomplished. Resistance to motion by surfaces in contact is modified firstly by the nature of those surfaces, secondly by their area, and lastly by the weight or force imposed upon them. Exactly why oil should be a lubricant any more than water or a mucilaginous or emulsive body has not as yet been determined, and what its molecular condition has to do with it is not yet definitely ascertained. Oil applied between two surfaces or bearings, fills the superficial pores of the metal and forms a film between the surfaces and thus keeps them apart, and the particles of oil are made to move amongst themselves and keep these surfaces from absolute contact.

Too little attention is paid by users of machinery to adapting the quality of the oil to the work to be done; for instance the cotton or woolen mill which uses lard or so called "heavy" oil on their engine and spindles would find the latter absorbing or destroying much of the power of the former simply in overcoming the resistance due to the viscosity or "heaviness" of the oil itself, for we must remember that the absolute resistance of the spindle is but slight, and even a slight adhesiveness due to the oil itself, would almost equal the normal resistance of the unoiled spindle.

Then again, the tendency to gum or thicken of the oil in question adds to its undesirability, and when we see this resistance multiplied by the thousands of spindles at work we can imagine the drain of power simply in overcoming the resistance of the oil. Paraffine oils and other refined derivatives obtained from petroleum are peculiarly adapted for all this work—heavy or light—for by a judicious admixture of them with animal oils for the purpose intended an oil may be obtained suitable for any work. In this class of oils the tendency to gum or oxidize is checked, as the petroleum holds in solution the other oils, and being non-evaporative and non-oxidizing itself, it imports those properties to the oils in combination.

The skillful manufacturer can now produce an oil which will run a watch or clock or sewing machine, and all the way up to the ponderous journal exerting tons of weight on its bearing, but we are yet to see whether the wants of an age demanding the most ponderous machinery and rapid motion will produce an oil with which to lubricate it. Fortunately in this country we are not called upon to devise a substance to lubricate the bearings of huge vessels of war as our English cousins have to do. The time may come when Yankee ingenuity and skill may be put to the test to produce a vessel and armament which will dwarf their new iron-clad, the *Shah.*

The crank bearings of brass and white metal of this vessel became so heated as to "melt and run" from the enormous strain imposed upon them. By using a phosphor bronze instead of the former metal this objection was somewhat overcome, but with the development of her 7,500-horse power it was found that while the phosphor bronze bearings became heated and cut they did not fuse and run as with the former metal. Now the British admiralty want an oil to prevent this excessive heating. Who can supply it?—*American Manufacturer.*

FIRE-PROOFS.—Jane Grey Swisshelm writes from Leipsic: "The double floors which are universal here ought to be so with us, for the space between is filled with ashes; so, with thick partition walls, it is next to impossible to burn a house down. I am told they have no fire-engines in Germany, and do not fight fire with water, but with ashes, clay, sand, old mats and axes. There has not been a fire-alarm in Leipsic since we came to it, which was the 27th last April."

HONEY AND ITS FALSIFICATIONS.—Max Singer says: Starch, bean flour, sand, gum, mucilage and gelatine are used as adulterants of honey. They are readily recognized, as they all thicken on heating, while the pure honey becomes thinner under those conditions. The addition of water alone is detected by the density, seven deciliters of genuine honey weighing one kilo.

Good Health.

Nervousness and How to Overcome It.

From an article on this subject in the *Herald of Health*, we make the following extracts:

The symptoms of nervousness are too many to mention, and vary in different subjects. The patient knows and feels he is ill, but cannot tell where or how. He becomes fretful and peevish and angry without a cause. He is easily startled, complains of irregular action of the heart, sleeps badly, and this loss of sleep spoils the next day's happiness. Resolution and courage fail, memory is impaired, he becomes tired and easily confused. He is subject to fits of melancholy, continually makes himself unhappy. He looks on the dark side, and seems to have no silver ray to line the clouds of life. If the nerves of motion become weakened the sufferer has little pleasure in either bodily or mental exertion. The appetite fails, becomes capricious, inconstant; the patient complains of a bad feeling, a pain in the head, flatulence, irregularity of bowels. Woe be to him now, if he flies to alcohol to stimulate his failing powers!

I shall not here enter into the symptoms of hysteria, so often the result of nervousness in both men and women.

Now, from whatever cause or combination of causes nervousness has been produced, if happiness and health are to be restored, the causes must be removed and the injury they have caused be repaired. For in proportion to the weakness of a man's system and the enfeeblement of his nerves, will be the liability of his falling a victim to other and more fatal maladies; and thus it is that every day we find such diseases as bronchitis, consumption, Bright's disease, brain disease, and insanity following at the heels of nervousness.

The indications for treatment are fourfold. First, we must remove the cause, restore the tone of the heart, improve the blood. All injurious habits must be given up; late hours and intemperance in eating abandoned; smoking, if practiced, stopped. This done, the patient is on the road to a cure, for nature is very kind when she has a chance, though she is dreadfully ornel when abused.

The food is most important. It must be abundant and wholesome—neither too much nor too little. It should not be sloppy, and soups had better be avoided so long as solid food can be taken. Rise from the table feeling you have had enough, but not oppressed with what you have eaten. Many a man has lived to old age by following this rule. The bread should be stale, and no very heating food taken.

Eight hours' sleep should be taken every night if possible. This alone will nearly cure. "Early to bed and early to rise," should be the motto. Sleep is the salvation of the nervous system. When there is strength, a cool bath, short and quick over, with much friction under a sheet, should be taken every morning, and a reaction secured. Without a reaction much harm results.

The exercise should be moderate and pleasant. Riding, driving, rowing, light physical labor, are all good. Breakfast early, dine at one or two, and sup two hours before going to bed; drink no tea.

Take no narcotics to make you sleep. A few raw oysters before bedtime are worth all the narcotics in the world, are easily digested, and furnish material for restoring nervous tissue and blood. If you wake up in the middle of the night, sometimes a small, stale biscuit eaten will send you off to sleep again.

A change of scene, air, and cheerful society, with sea-bathing, are excellent agents for curing nervousness.

Avoid physic—it exhausts the tone of the system, the very thing you would restore.

Above all, keep up a good heart, and a firm reliance on the great Author of life.

Metallic Poisoning.

Some years ago a superior sort of candles was introduced, which looked well and gave a remarkably clear, bright flame. But people who used them became affected with strange symptoms. The doctors were consulted, and it was found that the candles derived their attractive qualities from arsenic being used in their manufacture in such quantities as to be dangerous to health—if not to life. The fact was made public, the new candles being nicknamed "corpse candles;" and they proved, no more than the dog of the story, able to survive the imposition of an ill name. They disappeared, but have reappeared in Paris, where a rich lady, living in a fashionable quarter, lately became ill in such a way that she was supposed to be suffering from slow poisoning. The doctor who was called in found, one morning, the water placed by her bed covered with a thin film of arsenic. She had been in the habit of reading in bed, and the candles she used having been examined were found to be of dazzling whiteness, a whiteness, however, as was shown on analysis, caused by the admixture of arsenic, which, being volatilized during the process of combustion, had poisoned the air of the room. They were corpse candles. When once an article of this kind gets into the market it is very difficult to exclude it, as has been shown in the case of arsenical wall paper and other poisonous fabrics. Lead compounds, again, are very dangerous and insidious. The workmen in the manufactories in which they are prepared suffer greatly from their poisonous nature, and there does not appear to be any practical remedy. Lead poisoning in manufactories and workshops can only be prevented ultimately by a variety of minute precautions which it is very difficult to get workmen to take. A curious instance of lead poisoning was recently reported from St. Mary's hospital. A cab-washer, who was in the habit of working all night and leaving off when the public houses opened, had also acquired the habit of having a glass of beer or gin at that hour, and it was generally the first served in the house, so that he usually got the liquor which had remained all night in contact with the lead of the draw pipe. When taken to the hospital the poor man had completely lost the use of his upper extremities, and his voice was reduced to the merest whisper. His gums showed the well known blue line indicative of lead poisoning, and some of the gin which he had drunk, being tested, gave 1.430th grain of lead per fluid ounce. The well known proverb promises the worm to the early bird; here the early bird has had a narrow escape from the worm.—*Iron.*

Antidote for Poison Oak.

J. H. Sherman, M. D., writes as follows: Some years ago Dr. W. F. Jackson published an antidote for bee stings, mosquito bites, and, I believe, for the bites of insects generally. The information has been of great service to me, for it always relieves. Aqua ammonia, applied to the part affected, is the remedy. To compensate for this and other valuable hints for practice gleaned from our journals, I wish to call the attention of the profession to a sure antidote to the effects of poisoning from *Rhus toxicodendron* or *R. radicans.*

The antidote is fluid extract of *Aristolochia Serpentaria* (Virginia snake root), applied by means of a large camel's hair pencil. If applied on the earliest manifestation of the poison it will arrest the symptoms at once. My first trial was with a lady patient on Newton street, Boston. She was a fair skinned, light complexioned, delicate woman. At my first visit her face was so swollen, blistered and mottled that her best friends could not have recognized her; so badly were the integuments of the eyes swollen, that she could not see. She had a high fever and much burning, smarting pain over the face and in the head. My prescription was Bell, and local application of a weak solution of the acetate of lead. The husband of the lady aroused me early on the following morning, saying that his wife had passed a sleepless night, and desired my presence immediately. I found her in great agony, and on further investigation it appeared that the disease had been aggravated by the lead work. The extract of Serpentaria was now applied, and with the effect of producing almost immediate relief, so that in a few minutes the patient was quite comfortable. On the following day the inflammation and swelling had diminished to a degree which was to me a matter of surprise, and in a few days desquamation took place and recovery was complete.

Since the above case was treated I have used the remedy in other cases and with like results.

MINING AND SCIENTIFIC PRESS

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

One inch.....	1.50	4.00	12.00	40.00

Four weeks are rated a month.

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper inserted at special rates.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.25; three months, $1.25. Remittances by Registered letters or P. O. orders at our risk

GIVE YOUR FULL ADDRESS when you communicate on business to this office, especially in returning newspapers. The fact that your name is on our subscription list is of no assistance to us. Without sending your post office address we should have to look over thousands of names to find yours.

THE ORIGINAL ARTICLES in this paper are mostly set in solid type, giving in our columns one-third more reading than is contained in ordinary leaded matter.

ADDRESS all letters to the firm, and not to individual members, or others, who may at any time be absent from our office.

Our latest forms go to press on Thursday evening.

San Francisco:

Saturday Morning, Dec. 30 1876

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Mechanical Ore Separation and Concentration, No. 15; Flour Cooling Attachment to Grist Mills; The Responsibility of Stockholders; Mining Information Wanted, 425. The MINING AND SCIENTIFIC PRESS for 1877; A New Mining Bill; Index of Volume XXXIII; The Drainage of the Comstock Lode, 232-233. Patents and Inventions; Notices of Recent Patents; Bills Introduced in Congress Relative to California, 436.

ILLUSTRATIONS.—Flour Cooling Attachment to Grist Mills; Combination One Plunger Jig, 425. Underground Pumping Engine; Hydraulic Pumping Engine, 433.

CORRESPONDENCE.—Some Facts from the Black Hills; Globe District, Arizona; Old and New Mining Districts, 426.

MECHANICAL PROGRESS.—Automatic Nail Feeder; Strength of Cast Iron Fitting-Blocks for Boilers; The Smallest Turbine; Planing Mill Machinery; Fire-Proof Strong Room; Carbonic Acid as a Motor, 427.

SCIENTIFIC PROGRESS.—The Phenomena of Digestion; Ozone; The Carpet Anthrenus, 427.

MINING SUMMARY from various counties in California, Nevada, Utah and Arizona.

THE ENGINEER.—The Latest from the Jetties; The Work of the Engineer; French Engineering; A Chance for Railway Builders, 430. The Northern Pacific; Ship Canal Near the Gulf of Mexico; Gas Well, 431.

USEFUL INFORMATION.—Hints for the Apprentice; Relation of Oil to Power; Fire-Proofs; Honey and its Falsifications, 431.

GOOD HEALTH.—Nervousness and How to Overcome It; Metallic Poisoning; Antidote for Poison Oak, 431.

MISCELLANEOUS ARTICLES.—A Chance for Inventors; Leeds District, Utah, 426. Case-Bearing Moths, 430. Air Gas for the Lighting of Mines, Etc.; The Decline of Gold Mining in the Colony of Victoria; Rising Sun; Embalming; Sigel District; Hard Times in the Black Hills; Another Bridge Over the Mississippi; The Advance of Agriculture; Improving, 434.

SMELTING ORES.—Advices from Lima state that a new process for smelting ores has been introduced there. The item says "the process seems to vary from others merely in the fact that crude petroleum and superheated steam are employed in smelting ores. The heat generated is said to be immense. Experiments so far with refractory ores, both copper and silver, are very successful. The process takes much less time than that needed for ordinary methods, and a larger percentage of valuable metal is saved, little being lost by volatilization on account of the intense heat." The last few lines make us think that the writer is a "little off" in the knowledge of what he was writing about. The meager description given is unsatisfactory, but it strikes us that it may be the same process which was introduced here a few years since and made such a lamentable fizzle. They got intense heat in that, we recollect, and there was a small lead mine going up the chimney while the fires were running. Crude petroleum and superheated steam were used in that process as in this, but if the good people of Lima make no more out of the "new process" than we did on this coast they will not get rich very fast. Some of our good citizens were considerably out of pocket in trying to make the thing work here after buying the patent, and if the miners in Lima do not look out they will come to grief also.

MEMBERS of the New York Stock Exchange are not permitted to become members of the American Mining Board.

THE product of the leading mines in November was $3,554,262, of which $1,500,000 was gold.

THE SUTRO TUNNEL has cost, so far, the sum of $2,623,900. About 10 feet per day is now made.

The Mining and Scientific Press for 1877.

With the year 1877 commences the thirty-fourth volume of the MINING AND SCIENTIFIC PRESS. The paper has been established for so long a period of time that it is well known throughout the country, and we have no occasion to call attention to its continued and prosperous existence. The PRESS enters upon the labors of the ensuing year with strength, confidence and trust.

It will be the first year of the second century of the Republic. The indications are throughout the country that the years of depression are at an end, and that brighter days are dawning. It is believed that the Centennial resting and sight-seeing will mark the close of the era of the recovery from war curses, and that the clouded industries of the country will shine forth anew in a real and substantial prosperity. The year 1877 will be a year of work and of fit rewards for the toil.

The PRESS enters upon the work of such a year with renewed energy and in possession of the advantages which our work hitherto has gained for us. We shall give our journal a brighter face by means of a complete new outfit of type and other mechanical appliances. We have also in view improvements in our engraving department which will enable us to increase and improve our presentation of original themes in illustrations. In paper, press-work and all the matters which go to make up the mechanical appearance of the PRESS, the future shall surpass the past.

In the editorial conduct of the PRESS we shall labor with full enthusiasm and with untiring energy. We are full of belief in the principles and progress which we advocate. It is our ambition that every column of our paper shall contain something in thought or fact which our patrons will find of real value to them. Our work is done with the greatest care and watchfulness and with a full eye upon all sources whence light can come upon the industry in the promotion of which we are engaged. This policy is expensive, because of the labor which it demands. It would be far easier to fling together a weekly issue of the trash which rises uppermost in daily doings, and inflict it upon readers, but such a sheet would not answer our ideal. We search for that which is good and useful, and which has in it the quality of true success and progress, and nothing short of this standard is accepted. Upon this method of our work we believe we are gaining the success which is now attending our effort.

We take pride in our work for the good which we aim to accomplish. It is noble to labor in the cause of industrial progress and to think that the PRESS is a permanent agency from which earnest practical men can draw aids for their undertakings, and strength for their lives and hearts. We believe that labors such as we undertake are for the benefit of the community and result in far more general good than the most labored treatises issued in the interest of corporations and political parties. In these features of our work we feel that we have the full sympathies and approbation of our readers, and we believe that they may feel satisfaction in having contributed to build up a journal in which the truest interests of our coast receive fitting recognition.

Aside from these general considerations we have at this time special words to speak. While the clouds refuse the rain there is a feeling of lack and distrust prevailing. Some of the miners are becoming uneasy lest the clouds refuse to pour forth their usual abundance so that the mountains may store it up for future use. The depressed condition of the stock market is not likely to last forever, for it has been in just as bad a state before and still recovered. Although an unfavorable season is by no means to be feared yet, because the remedy may come speedily, we beg our readers not to allow any present unfavorable outlook to prevent their renewing any subscriptions which may expire with the year. There can be no doubt that if the season should disclose hardships the PRESS would be more than ever a friend and wise adviser. A man who labors in the face of disadvantage labors a thousand times as effectually if he have the aid of a thousand experiences to supplement his own. It shall be more than ever our task to furnish information which shall be valuable to those who struggle in the face of adverse conditions.

With the new year we should have at least 5,000 names added to our list, and each one of this number will aid us in the further improvement of our journal. A true newspaper is a great co-operative concern in which all readers are stockholders, and the more stockholders we have the more we can spend in pushing our paper forward in qualities of excellence and usefulness. Will not all our friends aid us to this end? We are indebted to them for many favors both to us and to our agents, and all these are appreciated. We ask a continuance of these valuable aids to our success, and look upon those who grant them as co-laborers with us for the good at which we aim.

A New Mining Bill.

The telegraph informs us that O'Neil, of Pennsylvania, has introduced in Congress a bill proposing to amend the mining laws, so that any person, association or corporation may own adjoining or adjacent claims in any mining locality. Said owner may include in the application for a patent all of said claims, provided that the amount expended for labor and improvements on any one or more of said claims shall equal in the aggregate the full amount now required to be expended on each separately. And after said application is filed, and pending the issuance of the patent, no further labor on said claims shall be required to hold them. The bill is now before the House mining committee.

The members of Congress from this coast are pretty well posted on mining matters and we should judge look out pretty sharp for the mining interests, so that there is little fear that any bill with disadvantageous features will pass without close scrutiny. As far as the brief telegram above describes the new bill we see nothing injudicious in it. As long as the full amount of annual expenditures is disbursed in any one claim of a bunch of them which belong to one person or combination, we see no reason why they should not be covered by one patent. It is very often inconvenient in such case to do a little work on half a dozen claims which might as well be done on one and to more advantage. Frequently four or five claims may be developed through or by means of one claim and the work done on that may do more to develop the others than little patches of work done on each of them.

The silver question and the big bonanzas have had the effect of drawing the official attention of the Government more to the mines than has ever before been the case, and there is no fear but that by proper representation the rights of the miners will be fully respected and every assistance given to the proper development and encouragement of the industry. The country looks to the miners for its supply of hard coin, and will do nothing to hinder the good work they are doing in getting it out of the bowels of the earth. The only features in changing the mining laws of late have been that the Government seems to be trying as much as possible to have the miners patent their claims. Most of the late legislation has a tendency to simplify the process and lessen the expenses of patenting. This feature is a good one, as it tends to establish permanent and undisputable title to mining property, so that it can be sold or bought on the same terms as other real estate. While we by no means desire much "tinkering" with the mining laws, whatever shows a desire to simplify them is commendable, and we at present see no reason to oppose Mr. O'Neil's amendment.

Index of Vol. XXXIII.

The close of a volume of our newspaper is a point of interest both to editors and readers. It marks the end of a period of newspaper life. As the index is prepared it stands as a review of the months through which the periodical has passed, and indicates the channels in which the types have had their course. It is a matter of some surprise and much gratification to us to be reminded by the solid columns of the index of the myriad of topics which we have presented during the last half year. They cover all the branches of home and farm life, and are so varied in their subjects and method that we can be sure that they have touched the many minds which are embraced in our wide circle of readers. The index reminds the reader of the fact that a volume of the PRESS is a treasury of much useful information, apt suggestions and earnest thoughts of life and purpose. This cannot well be otherwise, for many are the pens which have flown in our service during the past six months. As the editor looks over the index and notes the subjects, thoughts of the writers in their widely scattered homes come to mind, and he is prone to thank them again and again for the hearty assistance which they have given in the work of the volume.

To the reader the sight of the index will be very grateful. To the very many subscribers who save their papers carefully, the index comes as an aid to reference and they may now close and bind their files confident that they possess the key which will open to them desirable things. Although the index marks the close of a volume it is no indication of cessation from work and interest. For already the labor upon No. 1, Vol. XXXIV. is in rapid progress and if the new comer does not please our friends better than the one to which we now say good bye, it will not be because we have not tried to make it excel.

QUICKSILVER.—The receipts of quicksilver at this port for the year, up to December 1st, aggregated 57,600 flasks. The receipts in November were 6,951 flasks—the greatest number in the year. It is estimated that 500 flasks per month are sent to the Nevada mines from the quicksilver mines. On this estimate the *Bulletin* figures up the product of our California mines for eleven months at 63,100 flasks—the largest production ever before made by the coast. Quicksilver is lower in price now than it has been for some years, the rate being 50 cents per pound.

The Drainage of the Comstock Lode.

[Written for the PRESS by P. AUG. HUMBERT.—No. 4.]

Method of Raising Water with Underground Steam Engines.

The defects I, II and IV of the surface engines and usual pit-work, led principally to this class of engines, which they remove very effectually. Hardly no momentum exists, consequently much greater speed can be derived, while the pit-work consists of only the pump column, taking up no room and subject to no wear and tear; no heavy weights move in the shaft so that caves cannot happen through the working of the machinery.

Under the following circumstances they are to be recommended:

I. Where sinking is concluded.

II. Where the mine waters are cold enough to be used for condensation.

III. Where too great quantities of water such as to flood the machinery are not liable to be struck.

It will immediately be seen that this system is not adapted to the Comstock mines, still we will not pass this class of machinery without examining closer its defects and merits, as it may, if not in this locality, be well adapted to others.

Fig. 21 represents the appliance of this system.

The compound engine works the force pumps, which throw their water by the column *A* to the surface; while, say 50 feet deeper, is placed a hydraulic engine *H*, which receives its water as motor through the pipe *c*, which is connected with a pipe *A*; consequently the engine is worked by the total pressure given by the weight of the water column to the point *c*. The water which works the hydraulic engine is returned into the discharge of the hydraulic pumps at *d*, and with the actual amount of water to be lifted from the mine is thrown into the tank *f*, from which it is taken by the force pumps of the steam engine, and thrown to the surface.

The hydraulic engine is only a means to prevent the steam engine from being flooded, and is placed at the sump, where, even should it be under water, it can continue its work.

An objection is raised against this system by some on account of the condensation of steam, but this is of little consideration, for really a small benefit is derived when the weight of the column of steam is compared to the condensation which occurs when the pipes are well covered. An economy is certainly effected in the maintenance cost, when compared with the speer-rod system.

Conclusions.

I. The advantages which this system of engines have is to do away with all the momentum of the pit-work, consequently they can be run at greater speed.

II. Not so much danger of breaking any of the parts.

III. A saving in ruining expenses.

The idea that the valves of the pumps do not work well with such lifts is a mistake, and one of the best proofs of their success is the large number being erected both in England and on the continent.

III. Hydraulic System.

We have seen that while the underground steam engines removed some of the difficulties of the speer-rod system, yet there were others incurred in the work to be performed on the Comstock, which are of such a serious character that they cannot be advocated for this section of country.

There only now remains one other method which allows us to solve the problem, and that is the usage of hydraulic power. This system, while combining all the benefits of the underground engines, removes all the defects of the speer-rod system and enables to control with safety and economy the largest quantities of water at the greatest depths. The principle of this system is to substitute an artificial for a natural head of water, and to use this acquired power to raise the water from the mines. The water of the system is therefore simply used to transmit power in the same way as steam or compressed air. The machinery consists of four distinct parts:

I. On the surface, steam engine, boilers and pumps to accumulate the water power.

II. Accumulator or receiver of the water under a certain pressure and for its distribution.

III. Conducts or pipes which transmit the water under the required head, and return it to be re-employed in the system.

IV. Hydraulic engines and pumps, which do the work required in proportion to the transmitted water power from the surface.

Fig. 22 represents an appliance of these parts and shows the working of a hydraulic system.

A compound engine, *A*, works the accumulating pumps, *C*, which throw their water through the pipe *a*, in the accumulator *B*. The piston of the accumulator carries the box *F*, in which is put sufficient ballast to give the required pressure to the water, which is then led through the pipe *H*, into the mine and to the hydraulic engine *K*, and after usage returned by the pipe *G* to the tank *E*, from whence it is taken by the accumulator pumps to be used over again. By the forward and backward motion of the hydraulic engine water is pumped by the pumps *c'* and *c''*, and thrown through the pipe *L* to the surface. The pipe *M* discharges its water in the sump of

the engine *K* from the station below, aad the pipes *N* and *O* serve to work tbat engine, heing the continnance nf pipes *H* and *G*.

The stations are from 600 feet upwards apart; this distance is what determines the pressure to be used in the accumulator.

The sinking is done by placing a hydraulic engine at the last station and using speer-rods till the next station is attained, then the usual system is laid and the sinking engine moved down 600 feet more to recommence the work nf siaking the shaft.

No objection can he raised ngainst tbe lift of, say, 600 feet hy the pumps, because the pressure on the pump valves is often for underground steam engines 1,200 feet, aad nn inconveniences have been noticed. An objection is, however, raised to the pressure on the valves of the hydraulic engine, but this pressure does not actually exist, except in the pipes nnd cylinder of the hydraulic engine and is not therefore an injury to the wear of the valves, hut only a question of enongh metal to resist it.

Supposiag a system working with an accumulated pressure nf 600 pounds per square inch, at 600 feet depth, the pressure ia the pipe of the hydraulic engine would he 600 pounds, plus the weight of the column of water. For 2,000 feet in depth the pipes would have to resist a pressure of 600 pouads, plus the weight of a column of water of 2,000 feet, or taking 30 feet to equal 15 pounds per square inch, the pressure for any inconvenience; this difficulty is therefore removed.

II. The weights moving in the shaft being only water through pipes, creates no jar tbat might occasion caves.

III. The pumps can he run nt different velocities, not being connected together, hy admitting more water to the hydraulie engine.

IV. The pit-work in the shaft, consisting only of pipes, does not take up so much room as not to be able to add one or more systems if necessary, without removing the nld one.

V. If the system is calculated for 1,000 feet, and it is required to reach 2,000 feet, it only being a question of runuiug double as many hydraulic engines, it only requires more accumulated water, consequently more capacity in the accumulator pumps, and power to drive them, therefore aaother engine and accumnlator pumps nre placed on the surface, aad the required depth can he reached without total new machinery.

VI. Taking these last-named advantages in consideratioa, the machinery can he planned to do exactly the work required for the present, leaving it open in the future to increase this power in the simple maaaer mentioaed, consequeatly a reduction is here attained in the outlay of capital, eaabling the cost of pumpiag to he less.

This power beiag easily conveyed to any part of the miae, can be used to run winze engines, hour for 2½ lbs of coal, heing equal for 1,400 horse pnwer to a consumption of 1,400×2½ = 3,500 lbs of coal per hour; per 24 hours = 3,500 ×24 = 84 tons of 2,000 lbs, nr equal to 58 8-10 cords of wood—say 60 cords of wood at $12 per cord, heing equal to $720 per day, or about $260,000 per anaum.

The steam engine would have to indicate about 2,100-horse power to do this work, and the cost of the cagine, pumps, accumulator and hydraulic engines would be in the neighborhood of $900,000 in place.

Total Cost.

Wear and tear, at 10 per cent. per annum	$ 90,000
Interest, 10 per cent. per annum	90,000
Salaries, etc	80,000
Sundries	20,000
Fuel necessary	260,000
Total	$540,000

We will take the yearly cost at $500,000. In this section twelve mines would be benefited, so that their waters would be raised on aa average at $41,666.75 yearly. The dnily cost of raising this amount of water would he $1,110, or for about 70 cents per ton of ore now raised in this section. At 2,000 gallons per miaute, 2,880,000 gallons per 24 hours would be raised, at a cost of 40 cents per 1,000 gallons. It will be found that with the present system, at about 1,600 feet, the raising of 350 gallons per minute

Asbestos Fiber.—In another colnmn will be fnund the advertisement nf Mr. Philip Hinkle, agent fnr the "Ashestos pstent fiber company," of Philsdslphia, and to it we call the attention of enginsers and others using the kind of goods he has for ssle. Ashestns, as is well known, is a minsral indestrnctible by sither firs or acid, and this, with its non-conductive lnbricating and other psenliar qualities, rsuders it an article especislly adapted for the purposes referred tn. In its natnral stats it consists nf coarse fibsrs matted together in an intrsctihle mass, bnt hy the patent process nf the company namsd, this mass is disintegratsd and all earthy and sxtraneons matter removsd, and a soft, silky fiber prodnced. And this, hy anothsr patent process, is mannfactnred into steam packing, joints, bnsrds, eovering for boilers, pipes, etc., to prevent radiation of heat and condsnsation of stesm; writing papsr, etc. We are informed thst the fibsr company has the sole right for mannfacturing the pure asbestos fiber, and the usefnl prodncts msde therefrom, for which several pstents have bsen granted them, and that all other eo-oall-d pnre asbestos packing, etc., not hearing tbe stamp of the fiber company and the date of the patents, infringe npon their rights, and are of impure a-bestos. The fiber eompany, however, nse only the pnre utilizsd fiber in all their asbestos goods, and for their superior.ty over all others they received at the international exhibition at Philadelphia two medals of honor, and two certificates of the highest merit. They now offer their goods, through their agent, to the public of California with the fnll belief that all pnrchasers will be satisfied of their genuine and snperior qualities.

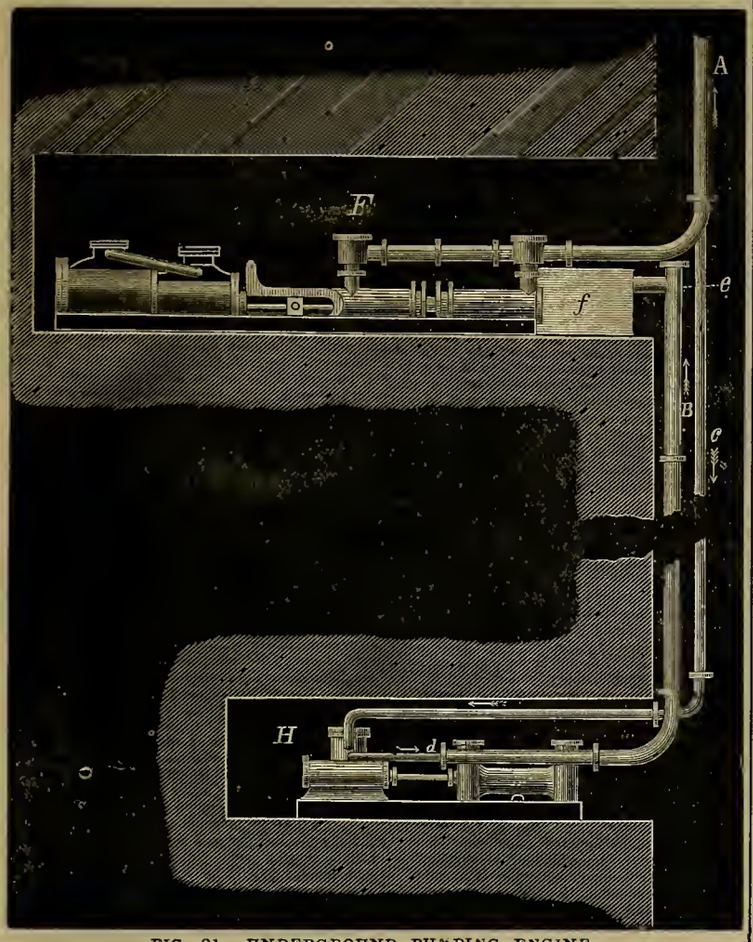

FIG. 21. UNDERGROUND PUMPING ENGINE.

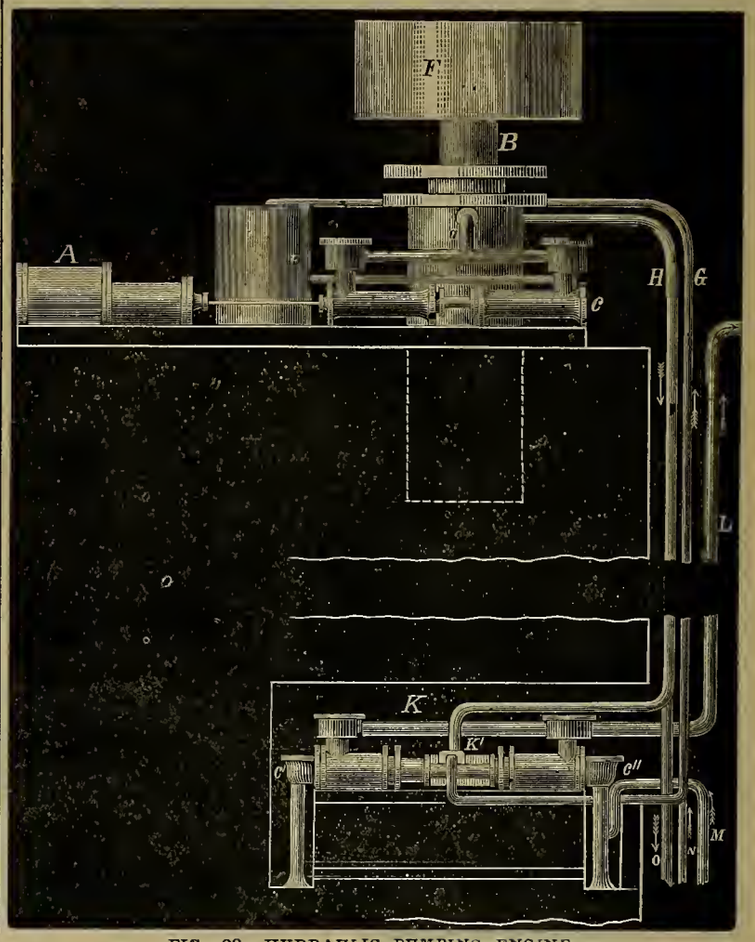

FIG. 22. HYDRAULIC PUMPING ENGINE.

2,000 feet = 600+2,000.15 ÷ 30, or 600+1,000 = 1,600 lbs per square inch.

Now the pressure in the discharge pipe of the hydraulic engine will equal the column of water returned, equal also to 2,000 feet, or 1,000 lbs, so that the weight on the valve of the hydraulic engine is only 600+1,000 — 1,000 = 600 lbs.

A slight increase exists on account of the difference of areas, but it amounts to nothing in the practice. We can therefore say that no greater actual pressure exists on the valves of the hydraulie engine than the accumulated pressure at the surface. The pressure in the pipes can easily be controlled by using pipes of sufficient thickness, and in the hydraulic engine by the usage of plungers and outside packing no leakage is to be feared.

It is a fact that although no system of draining mines has been more objected to by practical men, it has, wherever employed, even in Saarbruecken, Germany, where the crudest system ie in existence, given such satisfaction as to completely remove the objections advanced by the most prejudiced people. The most prominent engineers in Englnnd are advocators of this system for localities where the difficulties of pumping are much less than on the Comstock as far as depth, hot water, rapid sinking and inconstant quantities or water are concerned.

Conclusions.

I. The question of momentum can he here disregarded, ae each engine working independently of the other, the momentum of a 600-foot column is practically of no account, and even in the hydraulic engine for sinking, 600 feet of speer-rods and column has never been found of faas, etc. One accumulator can be employed for several mines, enabling to pump with less cost as far as fuel and lahor are concernod. The loss of transmitting this power is actually nothing, being only the friction in the pipes.

This method is so perfect in all fundamental principles that it is to be wondered how objections can be raisod sufficient to deter its introduction on the Comstock; it is impossible to impress sufficiently upon the minds of persons interested in this mining district the necessity of replacing machinery incapable of doing the required work in time to prevent the stoppages which will occur in the working of these mines, when it will be found that that which it has been tried here to demonstrate will come true, to-wit:

The system and machinery used on the Comstock for pumping is inadequate to do the work required.

It is not the quantity of water to be raised which will throw impediments in the way, there is no trouble about draining the mines, but the power used must be properly applied to insure success.

Before closing it may not he foreign to this subject to approximate what is actually necessary to drain these mines.

Between the Sierra Nevada mine on the north and the Imperial on the south, machinery capable of raising actually 2,000 gallons of water per minute, at an average of 2,500 feet, for the present would be perfectly sufficient to drain all the shafts included in the section.

Actual H. P. = 2,000×8×2,500 ÷ 480.60 = 1,400.

An actual horse power can be produced hy costs very nearly $300 per day, or 60 cents per 1,000 gallons.

The advantage in concentrating the productiou of a power as by hydraulic is too well understood, as far as economy is concerned, to need further explanation. The close proximity of the mines, the variable amount of water, the rapid sinking of the shafts, the great depths attained and to be reached, combined, point more forcibly towards the adoption of this system on the Comstock than in any other mining district.

For greater economy it is advised to make a combination of as many mines as possible, but should other reasons overrule this suggestion, each mine can pump for itself and accumulate the power required, and still all the advantages pointed out will exist, making this system more economical and insuring the easy handling of the waters.

Advices from Panama of the 16th, state that the commission which lately arrived from Europe for the purpose of making a new survey for an inter-oceanic canal across the Isthmus of Darien, left Panama on the 11th for the scene of their labors. The commission expect to be occupied with explorations and surveys until June next.

The Sutro Tunnel will strike the Comstock lode in the Savage property, at a depth of about 2,000 feet from the surface. When completed the tunnel will be about four miles long.

It is said that Dr. Linderman, Director of Mints, will recommend the establishment of one at Omaha.

The largest fire in Tokio (Yedo) since April, 1872, occurred November 29th, beginning just before midnight and lasting about eight hours. Sixty-five streets, containing 5,000 houses, were totally destroyed, and 50 lives believed to be lost. The loss of property is estimated at $10,000,000. The residence of the Austrian Minister was burned, and that of the United States Minister narrowly escaped. There were prompt and effective measures taken by the government for the relief of sufferers. The burnt region is rapidly rebuilding, with the introduction of great public improvements. The great fire in Tokio on the 29th ultimo was followed by another on the morning of the 2d instant, which destroyed 226 houses.

Monday night's overland train brought from Washington $2,000,000 in greenbacks for the office of the U. S. Assistant Treasurer. This money will be applied to the payment of demands against the Government. Mr. Sherman, the Treasurer, has on hand: National bank notes, $790,000; old worn-out notes, $460,000; fractional currency, $156,000; redeemed gold notes, $669,000—making a total of $2,075,000. In addition, he has nearly $4,000,000 in gold coin and $110,000 in silver

Air Gas for the Lighting of Mines, Etc.

It has been found that from petroleum can be obtained a light oil particularly well adapted for gas making purposes, with entire freedom from the sulpbur which is given off by ordinary coal gas during combustion. To this important matter our attention was drawn a few days ago whilst going through the works of the Protector lamp and lighting company, at Worsley, near Manchester, where are made the miners' safety lamps, patented by Mr. Teale, and where some hundreds are turned out weekly. Having seen the lamp tested in the Oaks colliery, near Barnsley, when the light was found to be very bright and soft, whilst the safety portion of the patent was all that could be desired, we were induced to inspect the mode of making the oil, and the means by which the apparatus for lighting up collieries or buildings was constructed. The air gas oils made by the company, when used in the patent apparatus, are capable of yielding a sufficiency of vapor to saturate atmospheric air at the lowest temperature. They belong to two distinct groups of light paraffine, the first being adapted for use in cold climates, and termed the Pentyl group, and the other most suitable for hot climates, and known as the Hextyl group. Together they have a specific gravity commencing at 628 and terminating at 669, but which by mixture can be made up to any required intermediate average gravity. It has a boiling point of about 126 degs. Fah., or 86 degs. below the boiling point of water, and is composed of 83¼ per cent. of carbon and 16¾ per cent. of hydrogen.

One pound of this oil gives off a vapor sufficient to saturate 51 cubic feet of dry air at a temperature of 32 degrees Fahr., forming a permanent gas of 30-candle illuminating power, when burned in suitable Argande consuming four cubic feet per hour. One ton of the oil contains 1,870 pounds of carbon, and 370 pounds of hydrogen, yielding 114,240 cubic feet of 30-candle air gas, being more than 12 times the quantity obtained from one ton of cannel coal, producing about the same high illuminating quality of gas. As the amount of light in all illuminating gases is in direct proportion to the amount of carbon which can be brought to a state of intense incandescence, and taking the diluent nitrogen in the air gas to be set off by the diluent marsh gas and carbonic oxide in coal gas, the great superiority of air gas over that produced from coal will be apparent. As to safety in the use of gas oils, it appears that there is no possibility of exploding them, as they are merely inflammable in the same way that oil of turpentine or spirits of wine are, and with proper care there can be no escape of any vapor from them. The gas generator containing the air gas oil in use is so constructed that no flame can possibly enter it, and is generally placed in an underground vault if connected with mines, or in an outhouse if used in a building. The patent apparatus consists principally of two distinct parts—a blower and a generator. The weighted blower is suitable for general use, and is set in motion by a wound-up weight formed of slotted iron plates placed on the shank of a hook connected to a wire cord passing over pulleys to a drum on the axis of the blower. This blower is constructed of a cylindrical case (partly filled with water, similar to an ordinary wet gas meter), within which revolves a wheel divided into four spiral compartments which act as pumps, the water forming a piston to force the air from the front inlet near the axis to the back outlet at the top. This is a simple and reliable blower, starting immediately a burner is turned on and stopping at once when it is turned off. The only attention which the apparatus requires is to wind up the weight when necessary, and which should be seen to every day, whilst once in about two months a small quantity of water should be poured in. The air is carried from the blower by a pipe passing through the wall of the building and underground to the generator, from which air gas returns into the place where it is required by another pipe at the side of the first, and is thence distributed to the burners.

One of the most approved arrangements for ordinary use is the constructing of any required number of separate generators or flats, according to the number of lights, which are worked either singly or several of them are connected together, air being directed by suitably disposed valves or cocks to flow continuously through the whole or only through any one or more, or it may be divided so as to pass partly through one and partly through another, according to the changes of temperature and seasons. Each generator exposes a large surface, by which to restore from the surrounding atmosphere to the liquid within an amount of heat proportionate to that abstracted by the vapor, and this it does continuously, thereby maintaining a medium condition of temperature by which the saturation of the air and consequent quality of the light is practically unvarying. This, together with the system of working, appears to be an essential feature of the success of the air-gas apparatus. The burners of the company are made of a chemically prepared mineral material, perfectly incorrodable, and does not in any way deteriorate by use, and consequently lasts for an almost indefinite period. The apparatus is made for any number of lights up to 500, or even more we believe should such be required. Not the least important feature in connection with the air gas, to our thinking, is that it does not affect the organs of vision the same as coal gas does, as the burners yield only products of combustion equally as harmless as those evolved from the purest wax.

The apparatus, we may say, is specially constructed for collieries or other mines, and the gas is made in the following manner: The reservoir is first filled with gas oil, then by means of a valve the oil is admitted as required into the generator, which consists of a number of tubes, partially filling them, but leaving sufficient space to allow air to pass over the gas oil. There is a weight which is wound up by a winding wheel; this acts upon a fan connected with the blower, forcing air into the generator, and in its passage turning air into gas, and passes into a governor, which regulates the pressure, and also provides a store of gas sufficient to keep the gas jets supplied during the operation of winding up the weight. The gas is conveyed in pipes in the ordinary way. The whole process is a most interesting one, whilst the gas seen in the works, offices and houses was bright, soft and singularly transparent, and evidently could not affect the eyes of those working by it or reading continuously for hours to anything like the same extent as coal gas does.—*London Mining Journal.*

The Decline of Gold Mining in the Colony of Victoria.

Gold mining was a few years since the staple industry of Victoria, and its palladium against all the various ills which from time to time befall newly settled countries.

From the discovery of gold in 1851 to the end of the year 1875, the total amount exported was 46,423,285 ounces, valued at $882,962,528. During the nine years from 1852 to 1860, inclusive, the average yearly export of this precious commodity was 2,643,131 ounces, and the average yearly value, $50,000,000. From 1861 to 1870, inclusive, the average yearly export was 1,644,641 ounces, and the average yearly value $33,000,000. Since 1870 the yearly export has been: In 1871, 1,647,389 ounces; 1872, 1,298,839 ounces; 1873, 1,291.014 ounces; 1874, 1,012,152 ounces; 1875, 794,164 ounces. The yield of gold in Victoria may be assumed to be equal to the quantity of Victoria gold exported. The discovery of this precious metal made Victoria, what it still undoubtedly is, the chief of the Australian colonies. But there is a gradual decline in mining industry and in the production of gold.

A journal published at one of the principal mining towns of Victoria says:

"The great mining industry of Bendigo will quietly fade into insignificance year by year, unless a reaction is provoked by interested means. Gold fields, cities and towns, will be undesirable places to locate in by and by if depopulation continues so rapidly to go on. The once great Ballarat has lost about 7,000 inhabitants in a few years; Castlemaine is dwindling down to a roadside nonentity; Ararat will soon only be represented by bricks and mortar; and Sandhurst is also following in the wake. Stowell appears to be the only money center that is attracting population at present. It is really painful to witness the continued fall taking place in the oldest mining sites of the colony."

Some of the journals take a less mournful view of the situation than that above quoted; but after all it does really appear to be a fact that the money interest is in a moribund state. Many mines now being worked do not return enough to make a fair wage, and others barely doing so. In too many cases it appears as if work at the mines was continued for purposes of speculation, dealing in mining stocks being as prevalent as in San Francisco; the shopkeepers and other hopeful people having, within the past year, lost largely by this indulgence. Many scientific men in Victoria have expressed decided opinions that the gold in Victoria is not half worked out; that the quartz reefs at present worked are only the outcroppings, and that throughout the colony, at far deeper levels, gold can be found in abundance.

Rising Sun.—While in Colfax on Saturday last we paid a short visit to the Rising Sun mine. Owing to the shortness of our stay, we are unable to give as minute description of the mine and mill as we would like to. The hoisting and other machinery are all of the latest inventions and work to a charm. The mill is kept running to its utmost capacity, and from prospects shown us, we think that large dividends will be in order shortly. The shaft is down over 600 feet; the 700-foot level will soon be opened. As the shaft goes down the ore improves in quality and evenness of distribution of the precious metal throughout the quartz. About 40 men are employed in the mine and mill, and the mine will prove to be quite a material aid in increasing the wealth and prosperity of Colfax. Mr. Neff, the superintendent, is very courteous and gentlemanly, treating all visitors well, and in the management of the mine has developed superior skill and ability in superintending the operations of the company. We wish the Rising Sun continued success, and hope every member of the company will bag a neat little fortune from the mine.—*Dutch Flat Forum.*

Embalming.—The *Lancet* describes Tranchina's method as follows: Eight decigrammes of arsenious acid, combined with a little cinnabar, are dissolved in nine kilogrammes of spirits of wine, and injected, *secundum artem*, into the carotid artery. For more than two months the body remains fresh, inodorous, inflexible and (thanks to the cinnabar) of its natural color. Thereafter desiccation commences, and it indurates so as to last for any time. Modifications by Ganual and others have improved upon Tranchina's method.

Sigel District.

Sigel mining district lies about 14 miles northeast from Gold Hill, between Oarson and Truckee rivers. The distance traveled to get there, by the old overland road and the balance of the roundabout way, however, is nearly twice that number of miles. The ledges of the district were discovered some years ago, but owing to the poverty or inability of the discoverers, their development has been necessarily slow and much delayed. Within the past few months, however, some of them have come into deserved prominence through the development of their real merit, assisted by the requisite capital, the old locators having either sold out or brought to their assistance financially able friends in San Francisco. For instance the

McClellan Consolidated,

Mentioned in our regular weekly mining report of November 27th, and also the Accidental Consolidated. The McClellan men have sunk a shaft 40 feet deep in the ledge, which crops out strongly at the surface. The vein material was principally quartz, giving good assays in silver and gold, and, owing to the easterly dip of the vein, the shaft passed through to the west wall, when it was thought best to discontinue sinking. A drift was then started to the northeast in the ledge, running in a distance of 50 feet. A cross-cut is now being made through the ledge, which is some 40 or 50 feet wide, to determine its full value at that point. The rock is looking and promising very finely, and good pay ore may be encountered any day. Sufficient has already been developed in the way of good ore prospects to induce sinking deeper and opening the mine at a depth where the vein matter is more concentrated.

The Accidental Consolidated

Also shows a prominent ledge, fully 25 feet in width between the walls, of a fine character of quartz, giving numerous excellent assays in silver and gold. Two shafts have been sunk upon it and, although a recent location, considerable work has been done. The proprietors of both this mine and the McClellan Consolidated are full of faith in the value of their property, and propose developing the same with energy and eventually with profit to themselves. There are other promising locations in Sigel district, which we will mention at some future time, but these are the best managed and most actively worked at present. Mr. A. C. Burrington, superintendent of the McClellan Consolidated, passed through here a few days since en route for San Francisco, to arrange for the winter supplies, and has probably already returned to the mine. During the coming season we shall expect to hear of good returns from Sigel district.—*Gold Hill News.*

Cheap Washing.—The *Gazeta Industrial* says a new system of washing has lately been introduced in some French towns, which system deserves to be especially mentioned. The economy which it affords is so considerable that its cost is reduced to the following figures: 5 centimes, (less than one cent), for a pair of drawers, 2½ centimes (¼ d.) for each shirt, etc. This is the process: One kilo, (2 lbs.) of soap is reduced with a little water to a sort of pap, which having been slightly warmed, is cooled in forty-five liters (10 gallons) of water, to which is added one spoonful of turpentine oil and two spoonfuls of ammonia; then the mixture is agitated. The water is kept at a temperature which may be borne by the hand. In this solution are introduced the white clothes, and they are left there two hours before washing them in soap, taking care in the meanwhile to cover the tub. The soapy water may be warmed again and be used once more, but it will be necessary to add half a spoonful of turpentine and another spoonful of ammonia. Once washed in soap, the clothes are put in warm water and the blue is applied. This process, it is obvious, spares much time, much labor and fuel. On the other hand, it gives to the clothes a whiteness much superior to that obtained by any other method, and the destructive use of the beetle is not necessary to clean the clothes from the impurities which they contain.

Hard Times in the Black Hills.—A private letter from a former Eurekian states that times are fearfully hard in the Black hills. The writer also says that the weather in that region is extremely cold. The freezing up of the water has operated to very materially curtail placer mining, which, so far, has been the mainstay of the country. He thinks there are plenty of good mines in the Black hills, including some very promising quartz ledges, but he gives it as his opinion that next April or May will be soon enough for any one to think of going there. He predicts that the Indians will keep quiet during this winter, inasmuch as they seldom do anything in winter that will cause them to break camp, a thing they might be forced to do if they interfered with the whites.—*Eureka Sentinel.*

Another Bridge Over the Mississippi.—The recent completion of a new railway bridge over the Mississippi, furnishes another illustration of the strong desire to remove obstructions to swift transportation at any cost. The new structure is of iron, and was built by the American bridge company for the Chicago, Milwaukee and St. Paul railway company, at La Crosse, and it now furnishes an unbroken line from Chicago to St. Paul. Still more important evidences of the tendencies of the age are afforded by the attention given to projects for tunneling the Hudson at New York and the British channel.

The Advance of Agriculture.

In the main there are two ways in which the science of the farm can be advanced. First, by constant and intelligent efforts among farmers to make their land and stock yield larger returns, and second, by studying more carefully the commercial laws which govern the sale and handling of products until they reach the consumer.

In the full and best discharge of his business the farmer is both a merchant and a manufacturer. He manufactures necessaries and he sells that which people cannot do without. He has this advantage at the outset, and there are a hundred chances for turning it more fully to his profit. But the greatest part of the farmer's business is production. Production with him is growth, either of plant or animal. But what is growth? Growth is material increase in accordance with natural laws. What is the understanding of natural laws? It is natural science. Who is he who raises the best crops? He is the man who can work best with the natural laws which regulate growth. And who is the man who works best by natural laws? He is a scientific man. Here we are, then, right upon a question which agriculturists have stumbled upon repeatedly. The man who raises the best crops and the best stock and keeps his soil in the best condition is the scientific farmer. He may be scientific without knowing it, but he is scientific nevertheless, for he gets the best growth, the best growth is gained by conformity to natural laws, and conformity to natural laws is working upon scientific principles. This is not what is generally understood by "scientific farming," but that makes no difference. There are several ways of reaching facts, but he who gets them, understands them and profits by them, is the scientific man. Although no wise man will neglect the careful study of what men have written about agriculture in books and newspapers, it is possible to conceive that a man may be scientific without them by closely reading the lessons which he sees in his land and animals. The reason "scientific" or book farming has so often failed is because some of its advocates have been reading with their hooks upside down or because they have not been wise enough to apply the truth which they read to their farming operations. They have been called "scientific farmers," and their failures have brought a name which they did not deserve into disgrace. They may have been educated men, they may have been wonderfully wise in certain directions, but they were not scientific *farmers*, because farming, like anything else truly scientific, must succeed.

It is difficult to see how the operations of the farmer, depending, as they do, upon natural laws, can be expected to reach a great advance without a better understanding of those laws, any more than one can see how an inventor can gain a great triumph without knowing the mechanical laws which govern the movement of wheels, the power of springs and levers and the extent of force which may be involved in his machine. Is it any more necessary for the mechanic who makes a mold-board, to understand what curve he can use to get the cleanest turn with the least resistance, than for the farmer to understand what is the natural effect of turning the furrow and what laws govern growth upon the inverted ground?

As we have claimed that every successful farmer is, to a greater or less degree, a scientific farmer, it will be appropriate to discover what natural science really is. Charles Kingsley says: "Science is knowledge of a natural object, its causes, its effect, its classification, or, in plain English, it is asking about an object which comes before us. What is it? How came it where it is? And what can he done with it?" What straightforward, simple questions these are, and yet the answers to them compose science. It is useful and practical science, and that is what we need in agriculture. The man who gets a larger yield from his field than that obtained from the one which lies next to his has gained possession of science in some way. What is necessary now for the advancement of the agricultural industry is that this valuable science, or knowledge of how to do it, shall be wider spread, and for this dissemination there can be no better way than for farmers to push ahead together for the improvement of practice in all branches of the industry.—*Rural Press.*

Improving.—Shady Run, until recently, had always been considered in the shade, but the last year's work in developing the mines has proven them to be rich and extensive. Therefore the erection of several business houses has taken place within the last five months. At present they have two hotels and two saloons. Mr. Talbot, the owner of one of the hotels, will open a store in one of his buildings in a short time. They have had several dances lately, and in order to keep up the reputation of the town, some of them make it a practice of putting heads on each other in the most approved style.—*Dutch Flat Forum.*

There is nothing like beginning with settled economical principles. Extravagance is a habit easily contracted and goes on increasing in volume as a snowball does when rolling down hill.

DEWEY & CO.

American & Foreign Patent Agents

OFFICE, 224 SANSOME STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, hook, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.,

ISSUED OCT. 1st, 1876.

Testing and Working Silver Ores.

The above is the title of an illustrated work of 114 pages, for miners and prospectors by Chas. H. Aaron, which has just been issued by Dewey & Co. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope:

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working sample, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles, Smelting, Mexican process, Kroencke's process, Chilean process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel, trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improved retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

The book is a serviceable one for miners' and prospectors' use. Price, post free, (in leather,) $2.00. Address Dewey & Co., MINING AND SCIENTIFIC PRESS, 224 Sansome street, San Francisco.

APPRECIATION ABROAD.—We copy the following from the *Mining and Monetary Gazette*, of London, Eng.: "We deemed it advisable, as affording valuable information to our readers, to publish in recent issues of *The Gazette*, the full text of the "United States Mining Laws and Instructions, by the Commissioner of General Land Office," taken from our talented contemporary, THE MINING AND SCIENTIFIC PRESS, of San Francisco. The documents have now been issued in a handsomely-bound volume by Messrs. Dewey & Co., the publishers of our transatlantic contemporary, and it will be found very useful to those already interested in American mines, and to others who may be tempted to embark in that enterprise in the States."

AMERICAN MACHINE —AND— Model Works

Experimental and fine Special Machinery, Dies, Taps, Punches, Reamers and other tools made to order. Planing, Gear Cutting, Machine Repairing, etc. Models and Patterns for Inventors promptly executed, in wood or metals.

I. A. HEALD, 514 Commercial St.,

Between Sansome and Leidesdorff Sts., San Francisco.

San Francisco Pioneer Screen Works,

J. W QUICK, MANUFACTURER,

32 Fremont Street, San Francisco.

Several first premiums received for quartz mill Screens, and perforated sheet metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

ERICH G. GAERTNER,

MINING ENGINEER.

All classes of mining properties reported on, consultations had on reduction of ores of all descriptions, plans for furneces and reduction works furnished, and the construction of them superintended. Ore tests made at the office,

309 California street, Rooms 8 and 9.

Assaying Taught. Practical Instructions on General Analysis.

J. J. Phillips M.E.

EXAMINER OF MINES, MINERAL ASSAYER &c.

Author of Explorers', Miners', & Metallurgists' Companion, 672 pages, 83 illustrations. Price 2d edition, $10.50. Also, "WEE PET" Assaying Machine. Price, $100.

D. LANGELL'S ASTHMA & CATARRH REMEDY.

Having struggled twenty years between life and death with ASTHMA, I experimented by compounding roots and herbs and inhaling the medicine. I fortunately discovered a sure cure for ASTHMA and CATARRH. Warranted to relieve any case of Asthma instantly, so the patient can lie down to sleep. By mail, $1.00 per box. Address D. LANGELL, Apple Creek, Ohio.

Circulars by Mail.

$55 to $77 a Week to Agents. Samples FREE, P. O. VICKERY, Augusta, Maine.

Continued from Page 436.

informed that it is the intention at present to work the ore for gold only, though some of it assays well in silver.

TYBO DISTRICT.

FREIGHT.—Eureka *Sentinel*, Dec. 22: The railroad managers say that Tybo receives more merchandise than any other of the outlying districts. It also furnishes a large amount of back freight, all of the teams that go there and to Belmont returning loaded to the guards with bullion. The freight on bullion from Tybo to this place is $14 per ton. The Tybo bullion is the highest grade base bullion made in Eastern Nevada.

WHITE PINE DISTRICT.

MORE ORE.—White Pine *News*, Dec. 23: The Eberhardt & Aurora company are continually blessed with more good luck than any mining company that we know of. Some time ago Capt. Frank Drake conceived the idea of running a drift from the great ore chamber in which they have been working for the past two years, and about two weeks ago came upon the ore body he was seeking. The ore is of high grade and the body is large, with strong indications of its developing into a large chamber. This is exceedingly good news for the company and is none the less so to the people of this district. Capt. Drake informed us that he would close down the mill about the first of January, and would not start up again until next spring. He has tried for two or three years to haul ore from the mine to the mill during the winter months, but has found it too expensive to keep the road free from snow. Besides the ordinary work on the tunnel and the incline shaft, he proposes to do a large amount of dead work during the winter. We predict that the company will have out more ore next year than its 30-stamp mill can work.

WINNEMUCCA DISTRICT.

THE MINES.—*Silver State*, Dec. 20: Work has been resumed on the Pride of the Mountain and Fairmount mines in Winnemucca district. The former is owned by the Humboldt M. & M. Co., and the latter by J. W. Clemo. Both are taking out ore, and have very encouraging prospects. Five tons from the Pride is now being taken to the Humboldt reduction works to test the richness of a body of ore recently discovered in the mine.

Arizona.

MINES.—Arizona *Miner*, Dec. 8: The Senator mine is hoisting ore from the 200-foot level and throwing about 24 tons into light every day. Col. Bigelow and the Hon. Johnston De Roche assert that their mine is "way up" and the bonanza of the Prieta. The Crook mill is pounding away continually with five stamps on custom work. The Crook mill is running on a twenty-ton batch of Crook ore from Shelltobrand's claim, and will start in next on a 150-ton lot from Curtin's claim on the Crook. Many of the old claims on Lynx creek are still paying expenses and some of the placer miners are making money. Many of the Lynx creek placer miners are gone and others going to the Black hills of Dakota. The Bullwhacker mine has two shafts and is piling up a large dump at the mouth of each. The Elliott Brothers are pushing things night and day at the Thunderbolt, and reducing the ores of the accidental and the amount of timber in their neighborhood amazingly.

Utah.

LEEDS DISTRICT.—*Salt Lake Tribune*, Dec. 21: The many arrivals from Salt Lake City show that northern Utah has concluded that the claims of our camp are at least worthy of investigation. All concur with us that the ores and ore bodies already exhibited justify the many boasts of superiority made, both as to their quantity and as to their quality. So much good ore is to be seen that all express surprise that so long a time has elapsed ere the claims of this country would be recognized. The real cause has been sandstone. Nobody could be found who believed in a sandstone formation—the thing was incredible. Owing to the district being nearly all located, miners who really desire to obtain a foothold are leasing mines. Several leases have lately been perfected and ore is accumulating rapidly. Negotiations for the sale of several properties are now pending.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

FOR WEEK ENDING DECEMBER 19TH.

ENVELOPES.—Alfred S. Addis, Anaheim, Cal.

LIQUID DROPPERS FOR BOTTLES.—Cornelius E. Davis, St. Helena, Cal.

RETURN TUBULAR BOILERS.—Robert Ehman, Vallejo, Cal.

BED CHAIRS.—Henry W. Fortune and Augustus H. Roberts, S. F.

DISTRICT TELEGRAPH BOXES.—George S. Ladd and Stephen D. Field, S. F.

DEVICES FOR PLACING SUBMERGED BLASTS.—Louis J. Le Conte, Oakland, Cal.

PLOWS.—Christien Myers, Marysville, Cal.

ÆRIAL MACHINES.—John B. Ward, S. F.

SPRING BED BOTTOMS.—Micajah Collins and Benjamin A. Lillie, Portland, Ogn.

KEYHOLE GUARDS FOR LOCKS.—Calvin H. Covell, Stockton, Cal.

BALE TIES.—William P. Gerlach, S. F.

MACHINE FOR WINDING PAPER INTO ROLLS.—Gardner Howland, Los Angeles, Cal.

LOCOMOTIVE SPRINGS.—James Jenkins, Carlin, Nev.

COMPOUND FOR ARTIFICIAL STONE.—Llewellyn L. Leathers, Oakland, Cal.

DREDGING MACHINES.—Allexey W. Von Schmidt, S. F.

GANG PLOWS.—Elisha W. Walton, Collinsville, Cal.

"The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

AERIAL MACHINE.—John B. Ward, San Francisco. This invention is a novel aero-motor, in which a mechanism is provided, combining the application of downwardly and horizontally acting currents of air with suitable guiding and directing planes, so that the machine may be elevated or depressed, driven forward or turned in any direction at will. Briefly described the operation is as follows: When the apparatus is set in motion upon a smooth space a blast fan will drive it forward upon wheels until a considerable speed is attained. A large plane surface is then turned to such a position that its front inclines upwards, and this, together with the effect of the downward blast from fans in the sides and a central screw, it is supposed will raise the machine from the earth. By the use of the plane and the gates the inventor claims to be able to turn the machine up or down, right or left at will. When the machine is to be brought again to the earth it is done at some favorable place where it can alight gradually and move along upon its wheels until it comes to a stop. The plane referred to is constructed with an arched top so braced and strengthened with ribs as to give the greatest amount of stiffness.

LIQUID DROPPERS FOR BOTTLES.—Cornelius E. Davis. This invention consists in the application to the necks of bottles, from which it is desired to draw liquid drop by drop, of a permanent device for causing the liquid to thus drop, which device is so applied that it will not interfere with the insertion of an ordinary cork or stopper in the mouth of the bottle. Liquid droppers have heretofore been made by perforating the cork which ordinarily stops the mouth of the bottle, but this method has the disadvantage of allowing the liquid to evaporate through the passages and is otherwise inconvenient and imperfect. This device, however, permits the bottle to be tightly corked whenever the liquid is not to be used and provides a very convenient and simple arrangement for this purpose.

GANG PLOW.—Elisha W. Walton, Watsonville, Santa Cruz county. This patent covers certain improvements in gang plows by which the inventor is able to accommodate the action of the plows to the character of the ground over which they travel. While ordinary gang plows operate very well for plowing over level ground, they either utterly fail or plow very imperfectly on side hills or in passing over hilly or knolly land. The improvements of Mr. Walton are intended to adapt this style of plowing machine to uneven land, and so that they can be operated on the side of a hill so as to turn a full and complete furrow.

BED CHAIR.—H. W. Fortune and Aug. H. Roberts, S. F. This invention relates to an improved manner of combining a bed extension with a chair frame so that when the extension is folded up into the chair frame a neat and comfortable easy chair is provided.

General News Items.

INSPECTOR-GENERAL DUMONT recommends the abolition of the Board of Supervising Inspectors of Steamboats.

THE convent at St. Elizabeth, Canada, was burned on Monday night. One hundred persons were in the building. Nine children are reported missing.

CAPTAIN HALL, of Detroit, who has just prepared the marine statistics of 1876, places the number of lake disasters at 636, and the value of property lost at $1,100,000.

A PETITION is in circulation for the reinstatement of ex-Paymaster Spaulding, and nearly all the members of the court-martial which tried him have appended their names to it.

THE steamship *Oceanic* has just made the fastest passage on record from Yokohama. She came in 14 days 15 hours and 20 minutes, the fastest previous time being that made by the *City of Peking*—15 days 12 hours.

THE Post Office Department calls attention to the provisions of the General Postal Union treaty made at Berne, which positively prohibits the transmission, in the mails, of gold or silver money, jewels or precious articles, or any other article whatever liable to custom duties.

IT is feared Turkey will resist nearly all the proposed reforms which the Powers considered the minimum they are entitled to demand. It is thought Elliott, the British ambassador, favors resistance on the part of Turkey, and his departure from Constantinople is considered reassuring for peace.

CERTAIN bondholders of the California Northern railroad company have commenced suit against Richard Cheney et al., for foreclosure of a certain mortgage, and to get possession of said railroad. Butte county intervenes, and sets up a claim arising from payment of $20,000 annually as interest on railroad bonds.

Bills Introduced in Congress Relative to California.

Mr. Luttrell, of California, has introduced in the House of Representatives the following bills relative to California:

A bill (H. R. 4,122) to quiet land titles in the State of California.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that, in all cases where the State of California has heretofore made selections of any portion of the public lands of the United States in said State, in lieu of sixteenth or thirty-sixth sections, which last named sections were, at the date of such selection, embraced by the exterior boundaries of valid Mexican or Spanish grants, and where the final surveys of such grants had not been made and finally approved at the date of such selection, and where the lands embraced in such selections have been listed and certified over to the State by the proper authorities of the United States, and where any indemnity school selections have been made by the State, and the lands embraced therein have been certified over to the State by the proper authorities of the United States, and the State has disposed of the same to purchasers in good faith under her laws, the lands so selected and certified over, as aforesaid, shall be, and are hereby, confirmed to the State of California, subject to the limitations and exceptions hereinafter contained; *provided*, that in case the State shall, by virtue of this Act, receive indemnity for sixteenth or thirty-sixth sections to which she was not entitled under existing laws, such sixteenth or thirty-sixth sections shall be subject to the disposition of the United States in the same manner as other public lands.

SEC. 2. That this act shall have no application to such indemnity lands as were, at the date of its passage, in the occupation of any *bona fide* settler, claiming the same in good faith under the pre-emption or homestead laws of the United States; *provided*, That at the date of such settlement the purchaser from the State, or those claiming under him, was not in possession of the land by virtue of occupation or cultivation of the same, or by reason of having improvements thereon; and that the land had not, at the time of such settlement, been certified over to the State of California by the proper authorities of the United States.

A bill (H. R. 4,174) to appropriate money to improve the navigation of the Sacramento river.

Be it enacted by the Senate and House of Representatives of the United States of America, in Congress assembled, that the sum of $100,000 be, and is hereby, appropriated, to be paid out of any money in the Trensury not otherwise appropriated, for the improvement of the navigation of the Sacramento river, between the town of Red Bluff and the bay of San Francisco in the State of California.

A bill (H. R. 4,173) to appropriate money for the improvement of the navigation of Feather river, California.

Be it enacted by the Senate and House of Representatives of the United States of America, in Congress assembled, that the sum of $25 000 be, and is hereby, appropriated, to be paid out of any money in the Treasury not otherwise appropriated, for the improvement of the navigation of Feather river, between the city of Marysville and the town of Vernon in the State of California.

GENERAL CROOK'S expedition is on its way homeward. Since the fight in the Big Horn mountains, small bands of Indian braves have been wandering about the country in this vicinity and keeping watch of all his movements, a fact that tends to make the surprise of the hostile Sioux by the troops a matter of extreme difficulty, if not wholly impossible.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office at San Francisco:

SUMMIT M. Co.—December 22d. Location: Plumas county. Capital stock, $2,500,000. Directors—Al Peck, J. F. Storer, E. P. Sanford, A. Martin and C. Lehman.

NEVADA AMALGAM REFINING Co.—December 22d. Object: To introduce and extend (by licensing) the use of certain patent rights, heretofore held and hereafter to be acquired by Conrad Wiegand, of Virgina City, Nevada, having for their object the mercurial separation of other metals and for the separation of other metals from gold. Directors—Joseph Perkins, Charles S. Capp, J. M. Gitchell, E. P. Flint and Conrad Wiegand. Capital stock, $250,000.

UNITED CARRIAGE CO.—December 22d. Object: A general delivery, transfer, express and transportation business in San Francisco. Trustees—G. S. Ladd, J. W. Coleman, James Gamble, C. S. Greathouse, John J. Valentine, William Ashburner and Stephen D. Field. Capital, $250,000.

SAN FRANCISCO WATER Co.—December 22d. Object: To supply the towns of Redwood City, Menlo Park and Mayfield with water. Trustees—J. J. Felt, Calvin Paige, William C. Talbot, Bartlett Doe and D. C. McRuer. Capital, $300,000.

NORTHERN LIGHT G. & S. M. Co.—December 27th.—Location: Shasta county. Capital stock, $6,000,000. Directors—Jacob Schrieber, Thos. A. Cunningham, Jas. White, John Hinton and Francis S. Munroe.

DEWEY & CO.

American & Foreign Patent Agents

OFFICE, 224 SANSOME STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissnes taken ont; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoronghly conducted.

Onr intimate knowledge of the various inventions of this coast, and long practice in patent hnsiness, enable ns to ahundantly satisfy our patrons; and our success and hnainess are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadiast friends and patrons, who fully appreciate our advantages in hringing valnable inventions to the notice of the pnblic throngh the columns of our widely circulated, first-class journals—therehy facilitating their introdnction, sale and popnlarity.

Foreign Patents.

In addition to American Patents, we scoure, with the assistance of co-operative agents, claims in all foreign conntries which grant Patents, including Great Britain, France, Belgium, Prnssia, Anstria, Baden, Peru, Rnssia, Spain, British India, Saxony, British Colnmbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portngal, Cnba, Roman States, Wnrtemberg, New Zealand, New Sonth Wales, Qneensland, Tasmania, Brazil, New Grenada, Chile, Argentine Repnhlic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are reqnired in European conntries, hnt the drawings and specifications shonld he prepared with thoroughness, by ahle persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Onr schedule prices for ohtaining foreign patents, in all cases, will always he as low, and in some instances lower, than those of any otber responsihle agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the conntry) SOONER than any other agents.

The principal portion of the patent hnsiness of this coast has heen done, and is still being done, throngh our agency. We are familiar with, and have fnll records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Sitnated so remote from the seat of government, delays are even more dangerons to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consnmed in trans mitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assnred that their communications and bnsiness transactions will be held strictly confidential by ns. Circnlars free.

Home Counsel.

Onr long experience in obtaining patents for Inventors on this Coast has familiarized ns with the character of most of the inventions already patented; hence we are frequently able to save onr patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acqnaintance of all parties connected with inventions and patent right bnsiness, helieving that the mntnal conference of legitimate hnsiness and professional men is mntual gain. Parties in donht in regard to their rights as assignees of patents or pnrchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money hut their inventions also, from this cause and consequent delay. We bold ourselves responsible for all fees entrnsted to onr agency.

Engravings.

We have snperior artists in our own office, and all facilities for producing fine and satisfactory illnstrations of inventions and machinery, for newspaper, book, circnlar and other printed illnstrations, and are always ready to assist patrons in bringing their valnable iscoveries into practical and profitable nse.

DEWEY & CO.,

United States and Foreign Patent Agents, pnhlishers Mining and Scientific Press and the Pacific Rural Press, 224 Sansome St., S. F.

Mining and Scientific Press,

Is the leading mining journal in America, and enjoys a large circnlation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast, it is decidedly popnlar and a standard ournal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivalled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, $4 a year, in advance. Sample copies post paid, 10 cents. As an

ADVERTISING

Medium for the Pacific Coast, it is superior to any other journal for all kinds of mining and hydraulic machinery and other mechnnical work, building materials new mannfactures and inventions. Our rates are very reasonable compared with those of other first-class journals. DEWEY & CO., Publishers.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY CUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose pntation is unsurpassed in his specialty.

Price $2.50 coin, or $3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographio Diagrams. 1867.

This work is unequaled by any other published, embracing the snbjects treated. Its authority is highly steemed and regarded by its readers; containing, as it oes, much essential information to the Miner, Millman, Metsllurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy,

Containing 672 Pages and 83 Engravings

BY J. S. PHILLIPS, M. E.,

Of California, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Eight Years.

PRICE, bound in cloth, $10.50; in leather, $12. Forwarded by mail for 50c. extra, at the MINING AND SCIENTIFIC PRESS Office, by

DEWEY & CO.

UNITED STATES

Mineral Land Laws, Revised Statutes,

And Instructions and Forms Under the Same.

We have just issued a pamphlet containing the general mineral land laws of the United States, with instructions of the Commissioner of the Land Office The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872, with Instructions by the Commissioner of the Land Office; Mining Statute of July 26th, 1866; Mining Statute of July 9th, 1870 Forms required under Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Survey; Application for Patent; Proof of Posting Notice and Diagram of the Claim; Proof that Plat and Notice remained Posted on Claim during Time of Publication; Registers' Certificate of Posting Notice for Sixty Days; Agreement of Publisher; Proof of Publication; Affidavit of $500 Improvements; Statement and Charge of Fees; Proof of Ownership and Possession in Case of Loss or absence of Mining Records; Affidavit of Citizenship; Certificate that no Suit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no Known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will be sold, post-free, for 50 cents. It should be in the hands of every one having any mining interests. DEWEY & CO., Publishers of MINING AND SCIENTIFIC PRESS, S. F.

Newspaper Fileholders.

Dewey's new elastic fileholders (black walnut), size of the PRESS, *Harper's Weekly* and *Scientific American*, for 50 cts. Larger sizes, to suit any newspaper, 75 cts. By mail, postpaid, 10 cts. extra. Cash with all orders. Patent allowed. Address, DEWEY & Co., Publishers, San Francisco.

Mining and Other Companies.

Cerro Bonito Quicksilver Mining Company. Location of principal place of business, San Francisco, Cal. Location of works, Carro Bonito mining district, Fresno county, Cal.

Notice is hereby given, that at a meeting of the Board of Directors held on the 13th day of November, 1876 an assessment (No. 1) of four dollars per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, 418 Californin street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 15th day of December 1876, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the eighth (8th) day of January, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors

J. W. CLARK, Secretary.

Office, Room No. 2, 418 Californin St. San Francisco, Ca

POSTPONEMENT.—The day for deeming the above assessment delinquent is postponed from December 18th, 1876 to January 8th, 1877, and the day of sale from January 8th to February 1st, 1877. By order of the Board of Directors, J. W. CLARK, Secretary.

Great Blue Gravel Range Mining Company.—Location of principal place of business, San Francisco, State of California. Location of works, Placer County, State of California.

Notice is hereby given that at a meeting of the Directors, held on the 22d day of December, 1876, an assessment (No. 7,) of Fifty Cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, Room 33, Merchants' Exchange, San Francisco, Cal.

Any stock on which this assessment shall remain unpaid, on Monday, the 29th day of January, 1877, will be delinquent, and advertised for sale at public auction and unless payment is made before, will be sold on Wednesday, the 14th day of February, 1877, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

W. BRYANT, Secretary.

Office, Room 33, Merchants' Exchange, California street, San Francisco, Cal.

Josephine Gravel Mining Company.—Principal place of business, San Francisco, Cal. Location of works, Brushy Canyon, Placer Co., Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the sixth day of December, 1876, an assessment of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, No. 531 California street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the eighth day of January, 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the 25th day of January, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

WM. SMALL, Secretary.

Office Room 1, No. 531 California street, San Francisco, California.

Mariposa Land and Mining Company of California. Location of principal place of business, San Francisco, California. Location of works, Mariposa county, California.

PICKERING ENGINE GOVERNOR.

Vallejo Foundry, October 17th, 1876.

MESSRS. NEYLAN & YOUNG, San Francisco,
Agents "Pickering Governors."

Gents:—The 10 two-inch Improved Speed Adjusting Governors I bought of you this year for my Patent Straw Burning Threshing Engines give splendid satisfaction. They far surpass for regularity of speed any Governor that I have ever seen, and I have seen all of the best kinds; I have seen the main belt fly off the pulley several times this season while threshing, and the engineer did not discover it, so perfectly was the speed maintained, until he was told of it; this I consider something wonderful; I consider the Governor absolutely perfect, so far as speed is concerned. I bought, and put on to one of my engines a Shive Governor, to see which was the best and after one season's trial I have no hesitation in saying they are as far superior to the Shive, or any other Governor that I have seen or used, as the Shiva Governor is to the old Butterfly Valve Governor. I wish you would send me the lowest price that you can furnish 25 Governors for next season's engines.

Yours, respectfully, I. L. HEALD.

THE LANE & BODLEY COMPANY,

John & Water Sts., Cincinnati, O.,

Sole Manufacturers of

BRUCKNER'S PATENT

REVOLVING FURNACE,

For Chloridizing, Desulphurizing and Roasting Ores.

—ALSO—

STEAM ENGINES, SAWMILLS, SHAFTING, GEARING AND MINING MACHINERY.

☞ Send for our illustrated catalogue.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND-POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING and TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

E. G. DENNISTON, - - - - Proprietor

HOTEL, RESTAURANT, PLUMBERS', GUNSMITHS', AND ALL KINDS OF METAL WORK PLATED IN THE MOST DURABLE MANNER.

THE O'HARRA CHLORIDIZING FURNACE.

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing by this Process:

Two cords of wood at $6	$12.00
Two firemen at $4	8.00
1500 lbs of salt at 1½c	22.50
Wear of shoes and power	1.50
Cost for 15 tons	$44.00
Cost for one ton	2.93⅓

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Consolidated Co.'s mines, in the Peavine District. For further information, apply to

D. J. O'HARRA,
Reno, Nevada.

LOOK

The Great Western Scroll Saw Co.'s New and Improved $5 00 Foot and Steam Power Scroll and Bracket Saw is the best one yet invented. With it men and boys are making from $3 to $10 per day. We will send you a Machine, six Saws, 15 Patterns and two feet of prepared wood on receipt of $5. Address,

GREAT WESTERN SCROLL SAW CO.,
Leavenworth, Kansas.

DEETKEN ROASTING FURNACE.

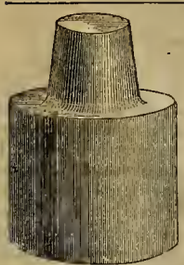
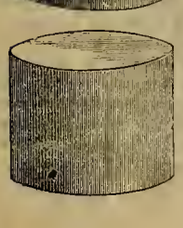
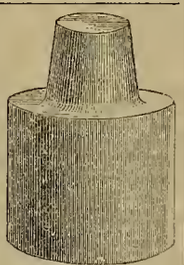
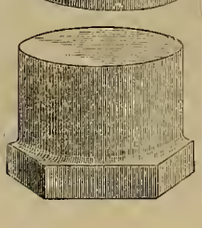
PATENTED

CAST STEEL SHOES AND DIES.









Guaranteed Cheaper than the Best Iron.

IMPORTANT NOTICE.

Reduction in Price from 16 Cents to 12 Cents Per Pound.

Owing to our largely increased business, the present low price of Iron from which our Steel is manufactured and the improved facilities for casting and forging, we take great pleasure in announcing that from and after this date we will supply our IMPROVED CAST AND FORGED STEEL SHOES AND DIES FOR QUARTZ MILLS at 12 cents per pound, delivered at San Francisco or Sacramento, instead of 16 cents, as heretofore.

We also furnish Steel Plates for Blake and other Ore Crushers, Steel Cut Gearing, etc., for Mills and Hoisting Works, Steel Pan Shoes, Battery Cams and Tappets, etc.

Address all orders, with dimensions or drawings, to

No. 224 Sansome Street San Francisco, Cal.

To Inventors.

To secure the services of able, reliable and every way efficient attorneys to properly prepare and present the case of an applicant for a patent at Washington, is an important item with those who have important inventions. It is not always that young inventors know just where to find such agents. Dewey & Co., the publishers of this paper, have been the leading patent solicitors in the United States west of the Mississippi for over twelve years past. Their specifications and principal business is done by skilled and experienced partners in the firm. They refer with pleasure to thousands of patentees for whom they have secured valued patents. Their pamphlet circular, containing hints and information to inventors, will be sent free on application at the office, No. 224 Sansome street, S. F.
